

Supplemental Tables

Supplemental Table S1: Comparison of GEE model fitness for variable selection using quasi-likelihood information criteria.

Model	QIC	Delta
log(ISI)		
M7	-1610.5	0.0
M8	-1608.9	1.6
M9	-1607.9	2.6
M5	-1604.1	6.4
M6	-1602.4	8.1
M4	-1599.2	11.3
M3	-1575.6	34.8
M1	-1229.7	380.8
M0	-1228.2	382.3
M2	-1219.2	391.3
log(ISSI-2)		
M8	-2476.2	0.0
M9	-2474.3	1.9
M6	-2471.3	4.9
M7	-2467.4	8.9
M4	-2458.8	17.4
M5	-2456.5	19.7
M3	-2450.5	25.7
M2	-2226.5	249.7
M0	-2171.0	305.2
M1	-2168.5	307.8

Given the number of possible combinations of outcome and predictor variables, only ISI and ISSI-2 with total TGFA (nmol/mL) were used to compare various GEE models and to select a final model. Baseline age was used as including both the original age and the time variable would result in collinearity. Column names: QIC is the quasi-likelihood information criteria (smaller values, eg. larger negative values, indicate a better fit compared to other models), Delta is the QIC minus the lowest QIC (models with delta <10 are considered equivalent). Models were:

- M0: log(ISSI-2) or log(ISI) = total TGFA (nmol/mL) + years from baseline
- M1: M0 + fatty acid by time interaction
- M2: M0 + sex + ethnicity + baseline age
- M3: M2 + WC
- M4: M3 + ALT
- M5: M4 + physical activity (MET)
- M6: M5 + total NEFA
- M7: M6 + alcohol intake
- M8: M7 + family history of diabetes
- M9: M8 + smoking status

Supplemental Table S2: Concentration (nmol/mL) and relative percent (mol%) values of TGFA in PROMISE participants at the baseline visit (2004-2006).

TGFA	Concentrations (nmol/mL)	Proportion (mol%)
18:3 n-3	45.2 (31.1)	1.5 (0.6)
20:5 n-3	9.9 (8.1)	0.4 (0.4)
22:5 n-3	8.3 (5.7)	0.3 (0.2)
22:6 n-3	16.7 (14.5)	0.6 (0.6)
18:2 n-6	548.6 (298.7)	18.0 (4.2)
18:3 n-6	15.1 (9.9)	0.5 (0.2)
20:2 n-6	10.2 (4.7)	0.4 (0.1)
20:3 n-6	10.2 (6.0)	0.3 (0.1)
20:4 n-6	38.2 (19.1)	1.3 (0.5)
22:4 n-6	4.6 (2.9)	0.1 (0.1)
14:1 n-7	5.1 (6.1)	0.1 (0.1)
16:1 n-7	126.1 (98.8)	3.8 (1.3)
18:1 n-7	71.6 (34.8)	2.4 (0.4)
18:1 n-9	1168.5 (592.2)	37.8 (3.7)
20:1 n-9	8.5 (5.2)	0.3 (0.2)
22:1 n-9	1.0 (0.6)	0.0 (0.0)
24:1 n-9	2.2 (4.0)	0.1 (0.1)
14:0	62.4 (59.0)	1.8 (1.0)
16:0	868.0 (556.2)	26.6 (4.4)
18:0	113.6 (63.4)	3.7 (0.8)
20:0	1.9 (1.3)	0.1 (0.0)
22:0	1.5 (1.2)	0.1 (0.0)
Total	3137.5 (1686.6)	

Supplemental Table S3: Raw estimates and confidence interval values for *time*-adjusted GEE models of the association of the TGFA (mol% and nmol/mL) and total clinically-measured TG with insulin sensitivity and beta-cell function outcomes using the 6 year longitudinal data from the PROMISE cohort. Estimates represent a percent difference in the outcome per SD increase in the FA. P-values were adjusted for the BH false discovery rate, with an asterisk (*) denoting a significant ($p < 0.05$) association.

22:5 n-3	8.7 (4.7, 12.8)*	7.9 (3.1, 13.0)*	4.3 (-0.7, 9.5)	1.7 (-0.8, 4.4)
22:6 n-3	2.4 (-1.1, 6.0)	-0.2 (-4.0, 3.8)	3.3 (-0.7, 7.5)	0.6 (-1.6, 2.7)

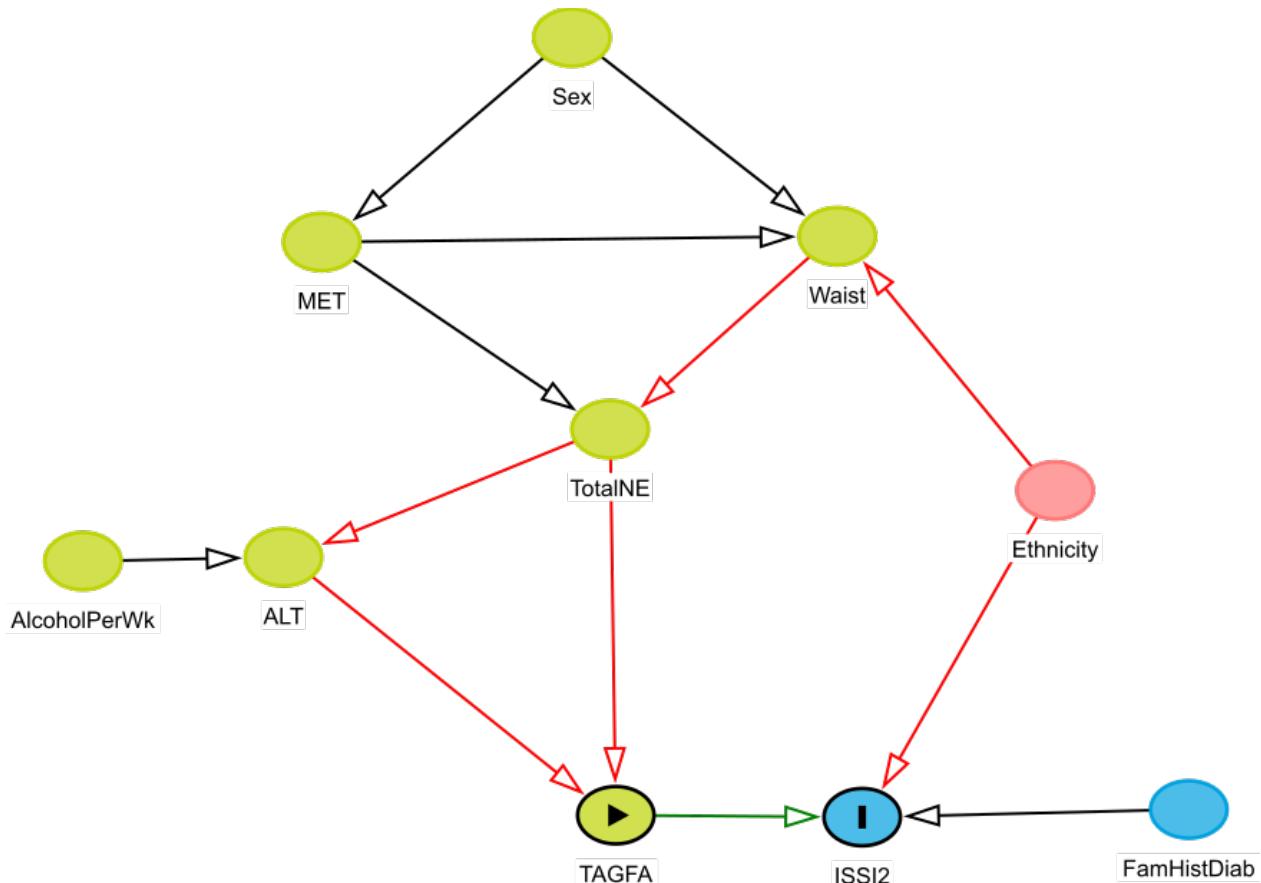

Supplemental Figures

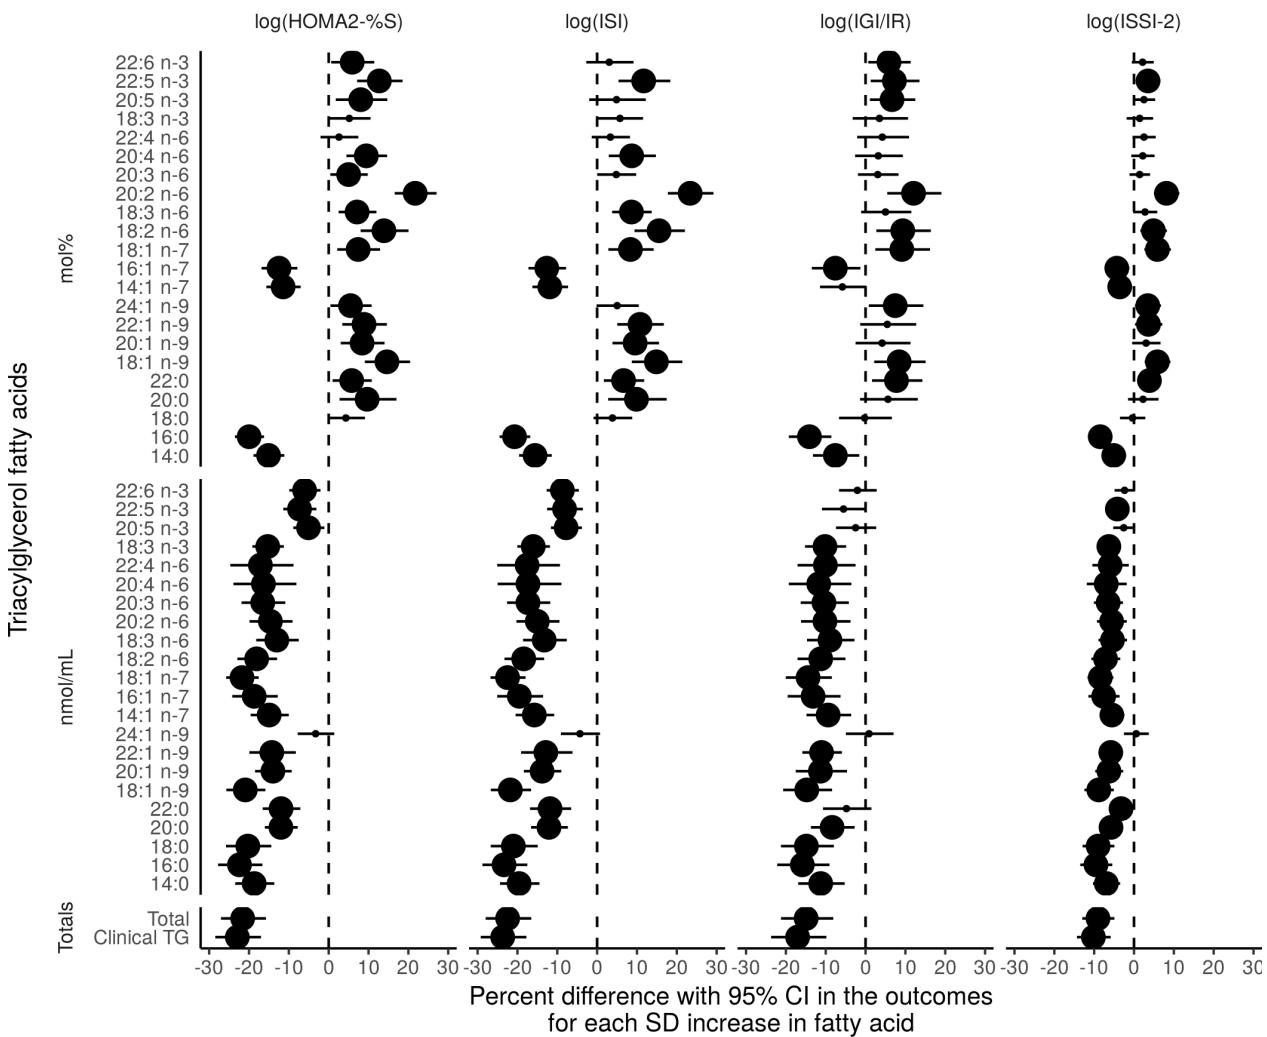

Supplemental Figure S1: CONSORT diagram of PROMISE participants over the 3 visits.

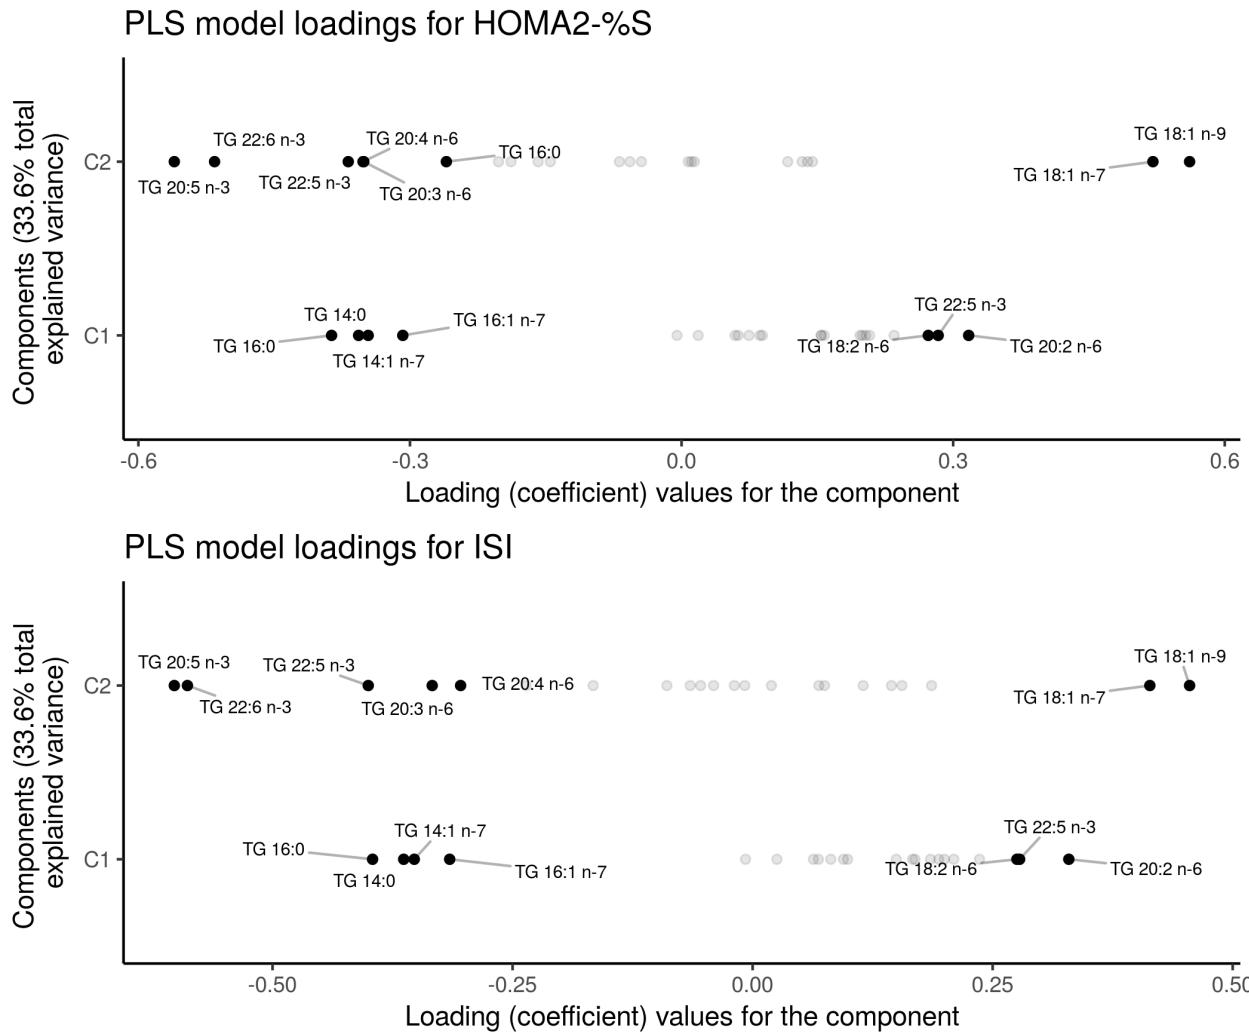

Supplemental Figure S2: Directed acyclic graphic output from the DAGitty online software for insulin sensitivity.

Supplemental Figure S3: Directed acyclic graphic output from the DAGitty online software for beta-cell function.

Supplemental Figure S4: Fully-adjusted (without waist size) GEE models of the association of the TGFA (mol% and nmol/mL) and total clinically-measured TG with insulin sensitivity and beta-cell function outcomes using the 6 year longitudinal data from the PROMISE cohort. Variables controlled for were follow-up time, baseline age, ethnicity, sex, ALT, physical activity, and total NEFA. X-axis values represent a percent difference in the outcome per SD increase in the FA. P-values were adjusted for the BH false discovery rate, with the largest dot representing a significant ($p < 0.05$) association.

Supplemental Figure S5: PLS loadings (or weights) for each of the TGFA. A larger loading indicates a higher contribution to the PLS component score.
