

Supplementary Figure 2.

Supplementary Figure 2. Apoptosis time courses for EPN cell lines 811 and 928 treated with floxuridine, bexarotene, and axitinib all at 1 μ M, as measured by live cell imaging (IncuCyte) of caspase 3/7 activation (green objects/mm²). Idarubicin (1 μ M) provides a positive control for apoptosis and untreated cells serve as a negative control.
