Supplementary Figure 1: Patient and tumor characteristics.

Supplementary Figure 2: Flow diagram of tumor-mapping analysis. The primary tumor specimen (A) is imaged using a closed-field fluorescence imaging device (B) and sectioned into breadloafs (C). H&E slides with areas of tumor tissue marked by a board-certified pathologist are analyzed, and tumor tissue distance to the deep margin surface is measured. Tumor depth in areas with fluorescence are compared to tumor depth in areas without fluorescence.
