Life Sciences Reporting Summary

Nature Research wishes to improve the reproducibility of the work that we publish. This form is intended for publication with all accepted life science papers and provides structure for consistency and transparency in reporting. Every life science submission will use this form; some list items might not apply to an individual manuscript, but all fields must be completed for clarity.

For further information on the points included in this form, see Reporting Life Sciences Research. For further information on Nature Research policies, including our data availability policy, see Authors & Referees and the Editorial Policy Checklist.

Experimental design

1. Sample size

Describe how sample size was determined.

No sample size calculations were performed. Sample size was uniformly determined by analyzing 6-20 animals for each condition for each replicate, with experiments having a minimum of 2 independent replicates (now indicated in Methods). In some instances, like experiments with more inherent variability (behavioral assays) more animals were analyzed per replicate (20-40 animals; this is now indicated in Methods). These sample sizes are sufficient to detect significance by the two-sided Wilcoxon rank-sum tests used in this study.

2. Data exclusions

Describe any data exclusions.

3. Replication

Describe whether the experimental findings were reliably reproduced.

4. Randomization

Describe how samples/organisms/participants were allocated into experimental groups.

5. Blinding

Describe whether the investigators were blinded to group allocation during data collection and/or analysis.

No data was excluded

All experiments were independently repeated at least twice with similar results (now indicated in Statistics and Reproducibility section of Methods); any case where replication failed is indicated in the corresponding figure legend.

There was no method of randomization; experiments were performed based on condition and genotype, and animals were not further allocated into experimental sub-groups necessitating randomization.

Investigators were blinded to genotype (control vs mutant or rescue) or experimental conditions (control vs experiment) for all experiments.

Note: all studies involving animals and/or human research participants must disclose whether blinding and randomization were used.

For all figures and tables that use statistical methods, con Methods section if additional space is needed).	firm that the following items are present in relevant figure legends (or in the
n/a Confirmed	
The exact sample size (n) for each experimental group/c	ondition, given as a discrete number and unit of measurement (animals, litters, cultures, etc.)
A description of how samples were collected, noting sample was measured repeatedly	whether measurements were taken from distinct samples or whether the same
A statement indicating how many times each experi	ment was replicated
The statistical test(s) used and whether they are one complex techniques should be described in the Met	e- or two-sided (note: only common tests should be described solely by name; more hods section)
A description of any assumptions or corrections, suc	h as an adjustment for multiple comparisons
The test results (e.g. <i>P</i> values) given as exact values	whenever possible and with confidence intervals noted
A clear description of statistics including central tend	dency (e.g. median, mean) and variation (e.g. standard deviation, interquartile range)
Clearly defined error bars	
See the web collection on stat	istics for biologists for further resources and guidance.
