

**Supplemental Figure 1.** Cancer-type specific survival analyses of sporadic cancer patients stratified by their mutant p53 residual transcriptional activities. The *P*-values (two-sided log-rank tests) for 16 cancer types were  $>0.05$  when comparing the survival probability of patients having p53 mutants with >0% residual transcriptional activity (relative to wild-type p53) to patients with inactive p53 mutants (0% activity). Dotted lines indicate median survival times and vertical lines on the Kaplan-Meier curves indicate patients who were censored.

**Supplemental Figure 2. Lifetime cancer survival of germline TP53 mutation carriers stratified by their mutant p53 residual transcriptional activity scores, excluding carriers of the R337H founder mutation.**

(A) Kaplan-Meier survival curves of female and (B) male patients grouped by those carrying p53 mutants with >25% transcriptional activity (excluding R337H [69% activity]) relative to wild-type p53 versus R337H carriers. (C) Kaplan-Meier survival curves of female and (D) male patients grouped by those carrying p53 mutants with <25% versus >25% transcriptional activity, excluding R337H carriers. (E) Kaplan-Meier survival curves of patients (pooled male and female) carrying >50% transcriptional activity (excluding R337H) versus R337H carriers. (F) Kaplan-Meier survival curves of patients (pooled male and female) subdivided by carriers of mutant p53 with <25% activity, >25% to <50% activity, >50% activity (excluding R337H), and R337H carriers. Dotted lines indicate median survival times and vertical lines on the Kaplan-Meier curves indicate patients who were censored. Two-sided  $P$ -values were calculated using the log-rank test.
