

Supplemental Figure Legends

Figure S1. Species, isotype, ELISA binding and EM and alanine-scanning assignment of epitopes, related to Figure 1. Antibody binding to EBOV GP lacking the transmembrane domain or the indicated regions illustrated in Figure 1 was assessed by ELISA and categorized as strong, moderate or weak. Epitopes were confirmed or assigned using ELISA results combined with alanine-scanning and/or electron microscopy results for the indicated antibodies. Isotype nd: not determined.

Figure S2. Neutralization of rVSV-EBOV by epitope class, related to Figure 2. Mean \pm SD for three replicates are shown. No antibodies in the mucin class exhibited neutralization activity in this assay and this class is not shown.

Figure S3. Survival curves for *in vivo* protection assay, related to Figure 3. Antibodies tested at USAMRIID facilities were assayed in 12 rounds. The mice were treated with 100 μ g/ml antibodies on day 2 post-infection and were observed and weighed across a 28 day period. Antibodies tested at Public Health Agency of Canada (Manitoba) were tested in one round. The mice were treated with 100 μ g/ml antibodies on day 2 post-infection and observed for a total of 21 days.

Figure S4. MAb binding to wild-type (WT) and mouse-adapted full-length EBOV GP, related to Figure 3. MAbs from K-means cluster groups 1, 2, 4, and 5 (Figure 4) were tested for binding with both WT and mouse adapted EBOV GP. The mAbs included Cluster 1 MAb VIC 115, which protected *in vivo* but did not neutralize. HEK-293T cells were transfected with constructs expressing wild-type GP, mouse-adapted GP, or empty vector, and mAb binding was detected by flow cytometry, as described for alanine scanning epitope mapping. Data shown are the average and standard deviation of four measurements of binding, expressed as relative light units (RLU).

Figure S5. Parametric ANOVA analysis of correlations between epitope class and phagocytosis assay readouts and polyfunctionality, related to Figure 6. Black and white lines indicate mean values. (A) The mean huADCP activity for both mucin and cap was significantly higher than fusion, GP1/2, GP1/Core and unknown (p values ranged from 4.2×10^{-4} -0.039 and 7.9×10^{-4} -0.04, respectively), whereas base was significantly higher than GP1/2 ($p=0.02$). (B) For mADCP activity, mucin had the highest mean value and was significantly higher than that of all other antibody classes (*, p values

ranged from 9.3×10^{-4} -0.034), and cap was significantly higher than GP1/Core, GP1/2, fusion and base (●, p values ranged from 0.03 to 0.048). (C, D) The mucin group had the highest mean value for both huADNP and mADNP assays (*, p values ranged from 1.2×10^{-4} -0.042) and the other classes in Tier 1, cap (●) and GP1/Head (^) were higher than base ($p=0.04$) and base, GP1/2 and HR2 (p values ranging from 0.043 to 0.048), respectively. In the mADNP assay, the unknown class had a higher mean value than that for GP1/2 ($p=7.6 \times 10^{-3}$). (E) The mean value for mucin polyfunctionality was significantly higher than that for GP1/2 and GP1/Core antibodies (*, $p=0.0028$ and 0.157, respectively) and the mean value for the Cap class was significantly higher than that for GP1/2 (●, $p=0.007$).

Figure S6. Glycan modification of VIC antibodies, related to Figure 7. The relative abundance of antibody glycan modifications was assessed. Of the 15 species and total amounts of G0, G1, G2, fucose, bisecting GlcNAc, sialic acid and mono-sialic acid, ANOVA identified (A) G0F, (B) G1F, (C) G1F', (D) G1FB and (E) total G0 as having a significant correlation with epitope class. Significant differences are indicated by bars with p values ranging between 4.4×10^{-4} and 0.049.

Figure S7. Machine learning algorithms and random forest regression predictions of protection, related to Figure 7. (A) Mean receiver operating characteristic curves of four machine learning algorithms (KNN: K-nearest neighbors; LR: Linear regression; RF: Random Forest; SVM: Support vector machine) trained and tested on dataset, D1, with raw neutralization readouts using a ten-fold cross validation scheme, related to Figure 7. Area under curve (AUC) values are shown in the legend. FPR: False positive rate; TPR: True positive rate. (B) Random forest regression predictions of protection using 10-fold cross validation; all antibody features were used as input for the predictions, related to Figure 7. The mean absolute error was 0.161. The importance factors of the top ten features used for the predictions are shown in Table S4.

Supplemental Items

Table S1. ELISA EC₅₀ values for GPΔTM and sGP, related to Figure 1.

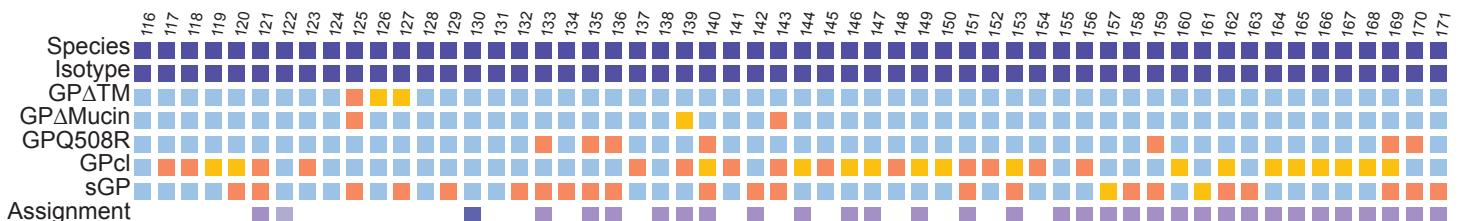

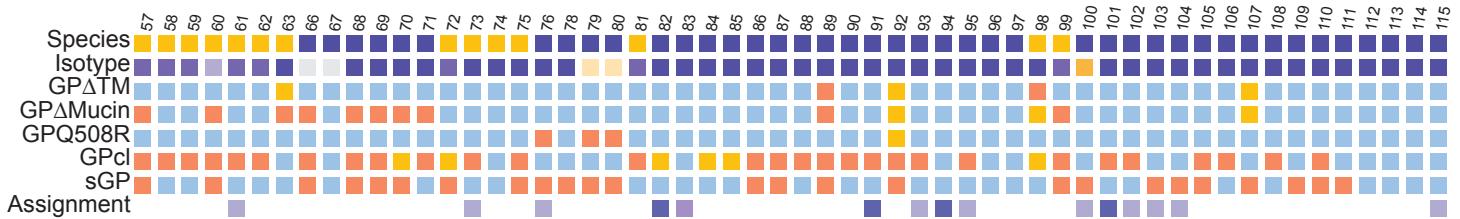

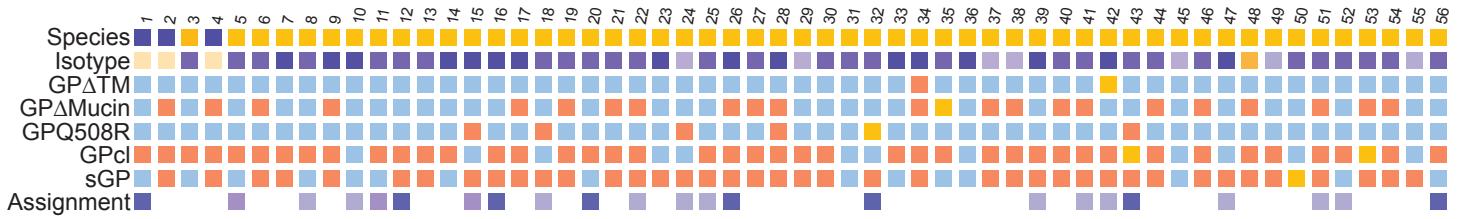

Table S2. Pan weights and testing round of EBOV-challenged mice, related to Figure 3

Table S3. Relative abundance of glycan modification of VIC panel antibodies, related to Figure 7

Table S4. Antibody features ranked by importance for predicting likelihood of protection, related to Figure 7.

Table S4. Antibody features ranked by importance for predicting likelihood of protection, related to Figure 7.

Rank	Importance	Feature
1	0.237483	IIP unneutralized fraction of rVSV-EBOV
2	0.176860	\log_{10} rVSV IC ₅₀
3	0.128681	IIP authentic EBOV neutralization
4	0.056267	IIP Δ VP30 EBOV neutralization
5	0.022053	Polyfunctionality
6	0.019130	Total SA
7	0.018971	G1
8	0.018086	CD107a
9	0.018039	IFN- γ
10	0.017258	\log_{10} GP EC ₅₀
11	0.014427	G2S1F
12	0.013914	MIP-1B

The importance factors for different antibody features determined from Random Forest regression predictions for protection of mice (Pedregosa et al., 2011). The 10-fold cross-validation of RF predictions are shown in Figure S7.
