

Supplementary Figures

Figure S1: Regulation of vinculin isoform expression by space flight

Immunoblots showing meta- and gamma-vinculin levels before and after spaceflight in both crew members. Below, loading control visualizing the staining of the skeletal alpha actin band on the membrane. kDa, kilodalton. R+1, R+14, R+16 denote 1 day, 14 and 16 days after return from space. Arrows point to the respective target protein.

Uncropped blots from Figure S1

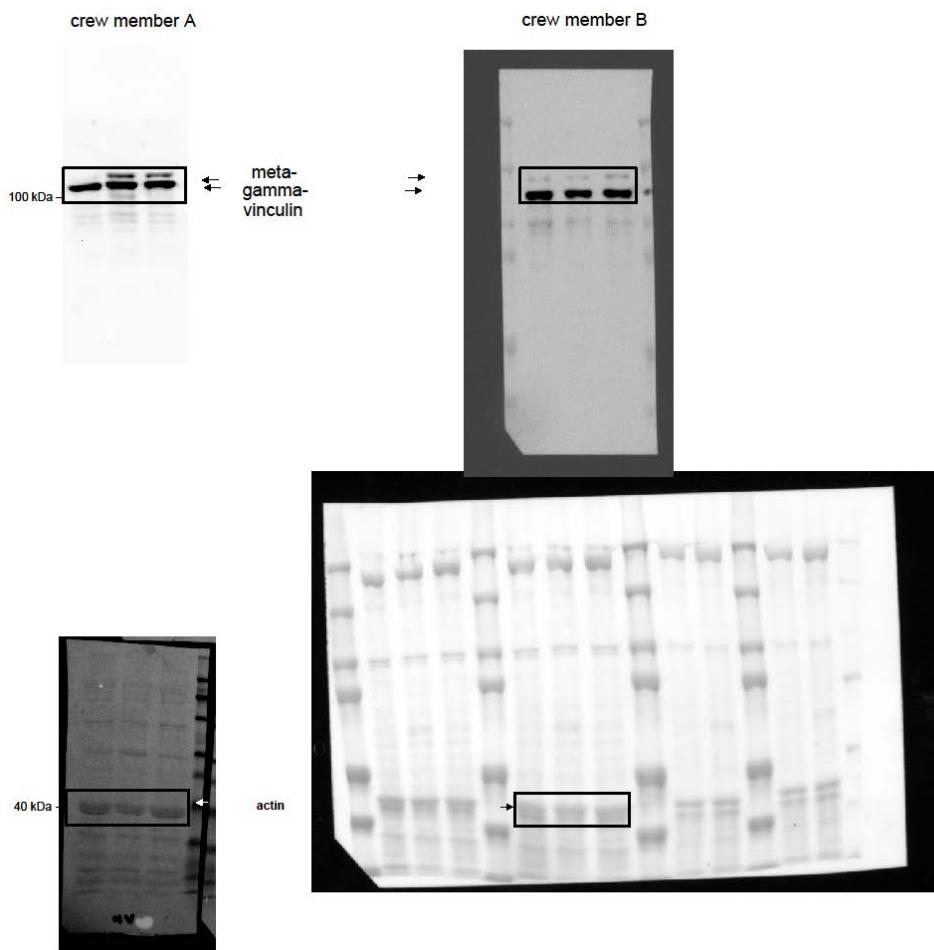

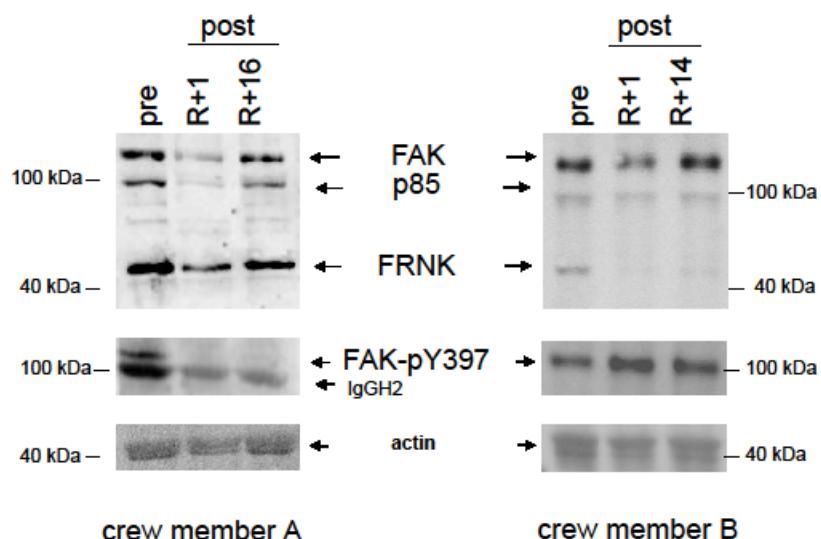

Figure S2: Regulation of focal adhesion kinase related proteins by space flight

Immunoblots visualizing the expression of FAK and FRNK (top) and FAK-pY397 (middle) in the two studied crew members before and after spaceflight. Below the immunoblots, a loading control is shown, visualizing the staining of the band corresponding to skeletal alpha actin on the membrane. Abbreviations: IgGH2; heavy chain dimer of immunoglobulins. kDa, kilodalton. R+1, R+14, R+16 denote 1 day, 14 and 16 days after return from space. Arrows point to the target protein.

Uncropped blots from Figure S2

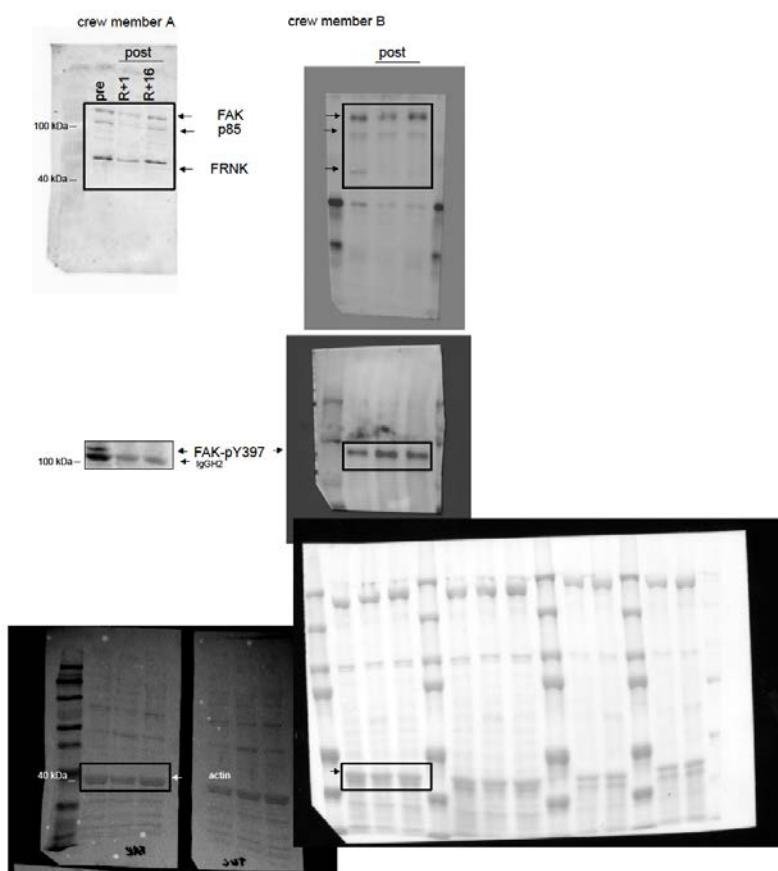

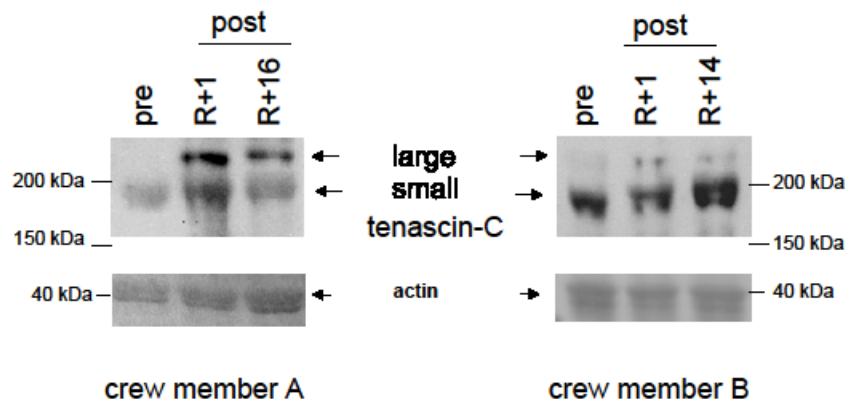

Figure S3: Regulation of tenascin-C expression by space flight

Immunoblots showing the level of the large and small tenascin-C isoform before and after spaceflight in the two crew members. Below, loading control visualizing the staining of the skeletal alpha actin band on the membrane. kDa, kilodalton. R+1, R+14, R+16 denote 1 day, 14 and 16 days after return from space. Arrows point to the respective target protein.

Uncropped blots from Figure S3

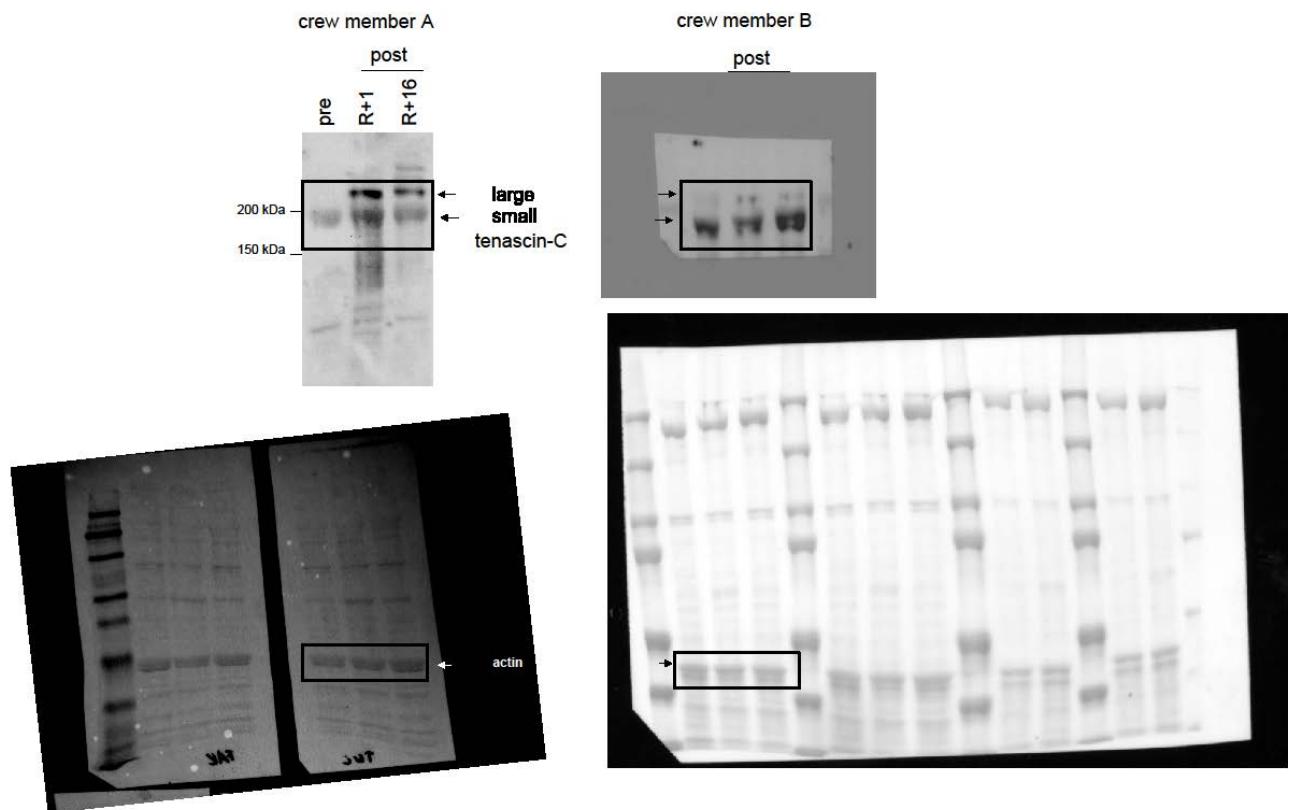

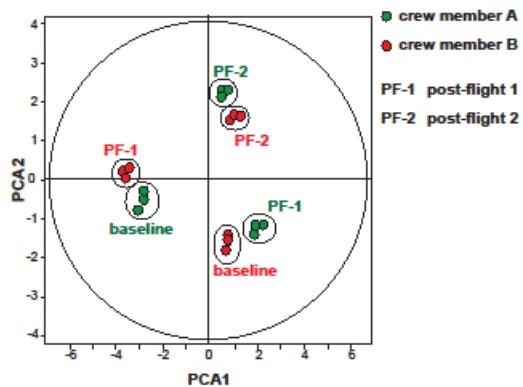

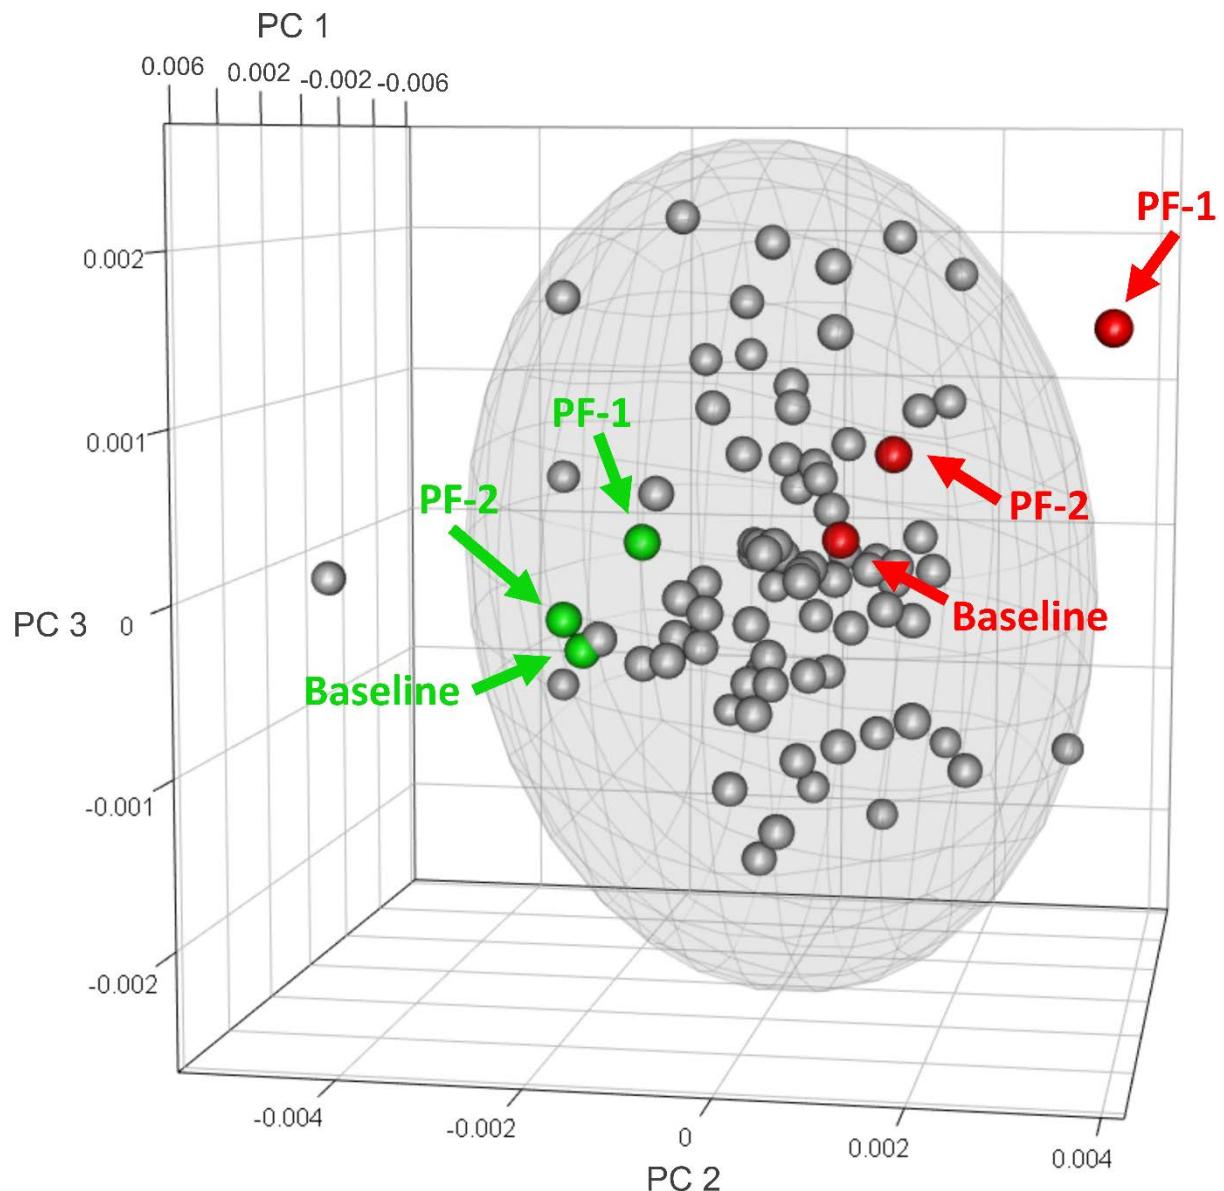

Figure S4: Principal component analysis (PCA) of muscle proteomic data

The PCA provided the overview of spots distribution in crew member A and B. In A, the protein data set of baseline was separated from PF-1 and PF-2 by PCA1 (59.2% global variation), highlighting the overall changes in protein abundance occurring immediately after flight and persisting two weeks later. PF-1 differs from PF-2 by PCA2 (25.9% global variation). Concerning B, baseline and PF-2 diverted from PF-1 through the PCA1 (61.4% global variation) suggesting their differences from PF-1. Furthermore, baseline diverted from PF-2 by PCA2 (18.5% global variation). See also Table S2.

Figure S5: Score plot of the first three components of the PCA calculated on NMR metabolomics data.

The explained variance was: PC1 55.7%, PC2 20.3%, PC3 9.6%. Each sphere represents a NMR spectrum: red crew member A, green crew member B, and grey controls. In grey the covariance ellipse.

Supplementary Tables

Table S1: Relationships between costameric gene products, which relate to fast fiber types

| FRNK per FAK | Baseline | PF-1 | PF-2 |
|--|-----------------|-------------|-------------|
| <i>Crew member A</i> | 2.01 | 1.98 | 2.09 |
| <i>Crew member B</i> | 0.58 | 0.34 | 0.23 |
| <i>meta-vinculin per gamma-vinculin</i> | | | |
| <i>Crew member A</i> | 0.06 | 0.47 | 0.34 |
| <i>Crew member B</i> | 0.05 | 0.05 | 0.08 |

Note the considerable increase in meta- per gamma-vinculin content in crew member A after space flight, and the relative stability of this ratio in crew member B.

Table S2: Proteomic analysis

The table lists those spots that changed from Baseline to PF-1 and PF-2.

Table S3: Testing schedule

| Crew Member | Test | Baseline | Post-Flight 1 (PF-1) | Post-Flight 2 (PF-2) |
|-------------|----------------------------|----------|-------------------------|-------------------------|
| A | Blood Sample & Biopsy | L-79 | R+0 | R+15 |
| | Magnetic Resonance Imaging | L-79 | R+3 | R+15 |
| | Plantar flexor testing | L-79 | R+1 | R+15 |
| B | Blood Sample & Biopsy | L-76 | R+0 | R+15 |
| | Magnetic Resonance Imaging | L-76 | R+3 | R+15 |
| | Plantar flexor testing | L-76 | R+4 | R+15 |

Baseline dates are relative to launch (L), and post-flight dates are relative to return to Earth (R+0 = landing day).
