**1 Supplementary Figures and Tables**

**Sup. Figure 1.** Sorting strategy for (A) transcriptome analysis, for deuterium enrichment analysis of (B) T-cells from blood, (C) T-cells from BM, and (D) granulocytes from blood.

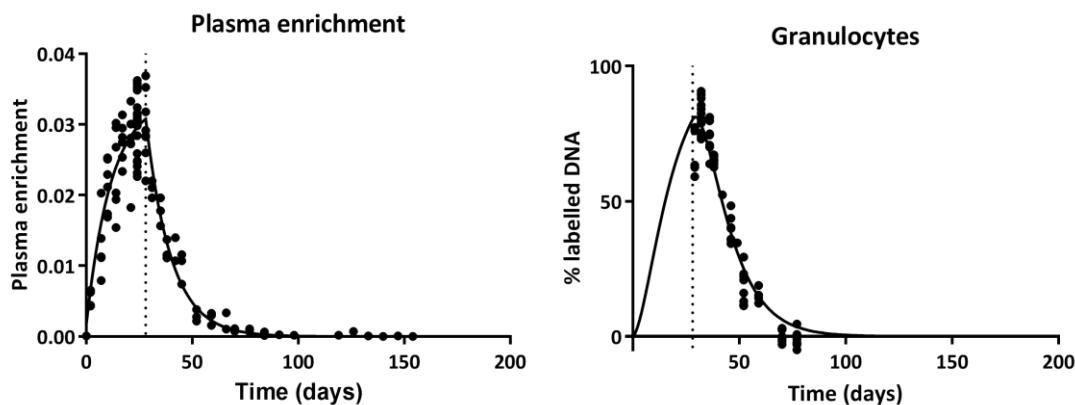

**Sup. Figure 2. CCR7<sup>-</sup> (memory) T-cells produce higher IFN- $\gamma$  than CCR7<sup>+</sup> (naive) T-cells.**  
 Median IFN- $\gamma$  production for sorted CD4<sup>+</sup> and CD8<sup>+</sup> CCR7<sup>+</sup>CD62L<sup>+</sup> (DP-N), CCR7<sup>-</sup>CD62L<sup>+</sup>, CCR7<sup>-</sup>CD62L<sup>-</sup> (DN-M), CCR7<sup>+</sup> (naive) and CCR7<sup>-</sup> (memory) T-cells from blood and LN stimulated for 20 and 70 hours with PMA/ionomycin. IFN- $\gamma$  production is shown as the OD of stimulated samples minus the OD of background. Error bars represent ranges. N=1-3.

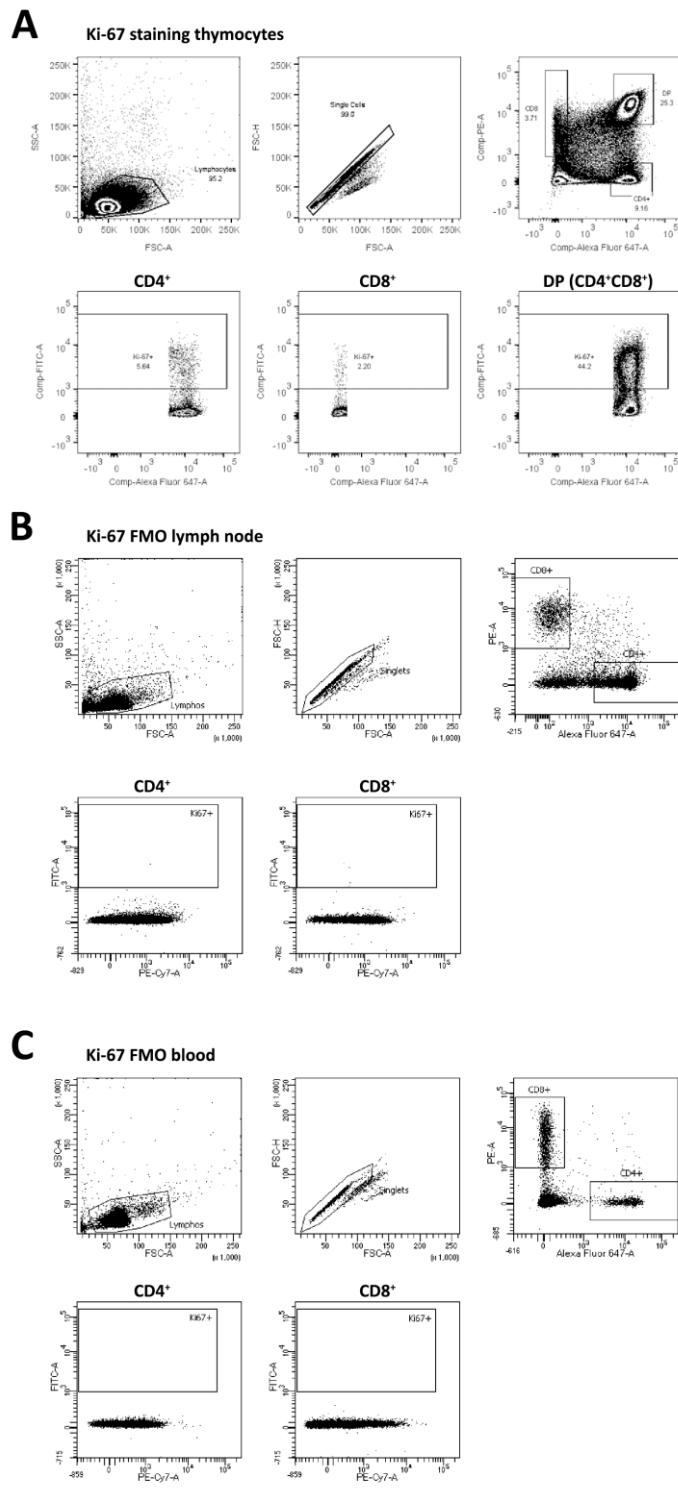

**Sup. Figure 3. Memory T-cells (CCR7<sup>-</sup>) have higher percentage of Ki-67 positive cells and reach higher deuterium enrichment than naive T-cells (CCR7<sup>+</sup>).** (A) Percentage Ki-67 positive cells in memory and naive CD4<sup>+</sup> and CD8<sup>+</sup> T-cells from blood and LN. Samples were compared using the Wilcoxon signed-rank test, p-values are shown. (B) Intracellular Ki-67 staining of CD4<sup>+</sup> and CD8<sup>+</sup> memory (CCR7<sup>-</sup>) and naive (CCR7<sup>+</sup>) T-cells from blood of a

representative goat. **(C)** Best fits to the level of deuterium enrichment measured in the DNA of CD4<sup>+</sup> and CD8<sup>+</sup> memory (CCR7<sup>-</sup>) and naive (CCR7<sup>+</sup>) T-cells from blood and LN. Label enrichment in the DNA was scaled between 0 and 100% by normalizing to the maximum enrichment in granulocytes (See material and methods). Data for memory T-cells (black dots) is also shown in Figure 3 and Figure 4. **(D)** Estimated lifespans in days of CD4<sup>+</sup> and CD8<sup>+</sup> memory (CCR7<sup>-</sup>) and naive (CCR7<sup>+</sup>) T-cells from blood and LN, and their respective 95% confidence limits.

**Sup. Figure 4. Best fit of the deuterium enrichment in plasma and granulocytes.** Symbols represent individual measurements during the up- and down-labelling phases. Granulocytes were used to normalize the data (see material and methods). Parameter estimates for the best fit are given in Sup. Table 1.

**Sup. Figure 5. Positive and negative controls for intracellular Ki-67 staining.** (A) Intracellular Ki-67 staining of  $CD4^+$ ,  $CD8^+$  and double positive ( $CD4^+CD8^+$ ) thymocytes of a representative goat. (B and C) Ki-67 fluorescence minus one (FMO) staining of  $CD4^+$ ,  $CD8^+$  cells from LN and blood of a representative goat.

**Sup. Table 1. Estimates for deuterium enrichment in plasma and granulocytes.**

	<b>Parameter</b>	<b>Estimate (95% confidence limits)</b>
<b>Plasma</b>	$\delta$	0.08433 (0.07486;0.09649)
	$f$	0.03381 (0.03184;0.03501)
<b>Granulocytes</b>	$c$	4.42 (4.39;4.66)

**Sup. Table 2. Average turnover rate per day for CD4<sup>+</sup> and CD8<sup>+</sup> T-cells from blood, BM and LN.**

	<b>Average turnover rate (95% confidence limits)</b>
