

S5 Figure. Real time PCR results for transcripts of the normal colonic epithelium (NCE) whose level differ between *Apc^{Min/+}* mice bearing colonic adenomas (T+) and *Apc^{Min/+}* mice free of colonic tumors (T-). The cycle number (ΔCT), normalized to GAPDH, is shown on the Y axis. Each dot represents the average of triplicate values from an individual sample. Medians and quartiles for each tissue type are indicated. WT, wildtype.
