

Figure S10

Figure S10. Intact biofilm architecture of *pilA₁* and *CD2831* mutant strains over-expressing *dccA*

Biofilms were grown from adhesive cells in TYt medium for 24h in the presence of anhydro-tetracycline inducer as described in Figure 9. At the end of growth, intact biofilms were stained and observed as described in Figure 8. For each strain, a representative section view close to the surface is shown, with the white bar indicating the scale (50 μm). The parental (630 Δerm *pdccA* in A and C) and mutant strains over-expressing *dccA* (*pilA₁* *pdccA* in B and *CD2831* *pdccA* in D) are shown.
