

Abbr.	Distance	Definition
CS	Cosine	$\text{Arccos}\left(\sum_x P(x)Q(x)/\sqrt{\sum_x P(x)^2 \sum_x Q(x)^2}\right)$
EC	Euclid	$\sqrt{\sum_x (P(x) - Q(x))^2}$
E2	Euclid ²	$\sum_x (P(x) - Q(x))^2$
KL	Kullback-Leibler	$\left(\sum_x P(x)\log\left(\frac{P(x)}{Q(x)}\right) + \sum_x Q(x)\log\left(\frac{Q(x)}{P(x)}\right)\right)/2$
JA	Jaccard	$(A + B)/(A + B + C)$
JS	Jensen-Shannon	$\left(\sum_x P(x)\log\left(\frac{2P(x)}{P(x)+Q(x)}\right) + \sum_x Q(x)\log\left(\frac{2Q(x)}{P(x)+Q(x)}\right)\right)/2$
MH	Manhattan	$\sum_x P(x) - Q(x) $

Figure S1. Measure of distance between ILDs. $P(x)$ and $Q(x)$ represent two ILDs to be compared. A, B, and C denote the specified area. For continuous ILD models, summation should be replaced by integration.

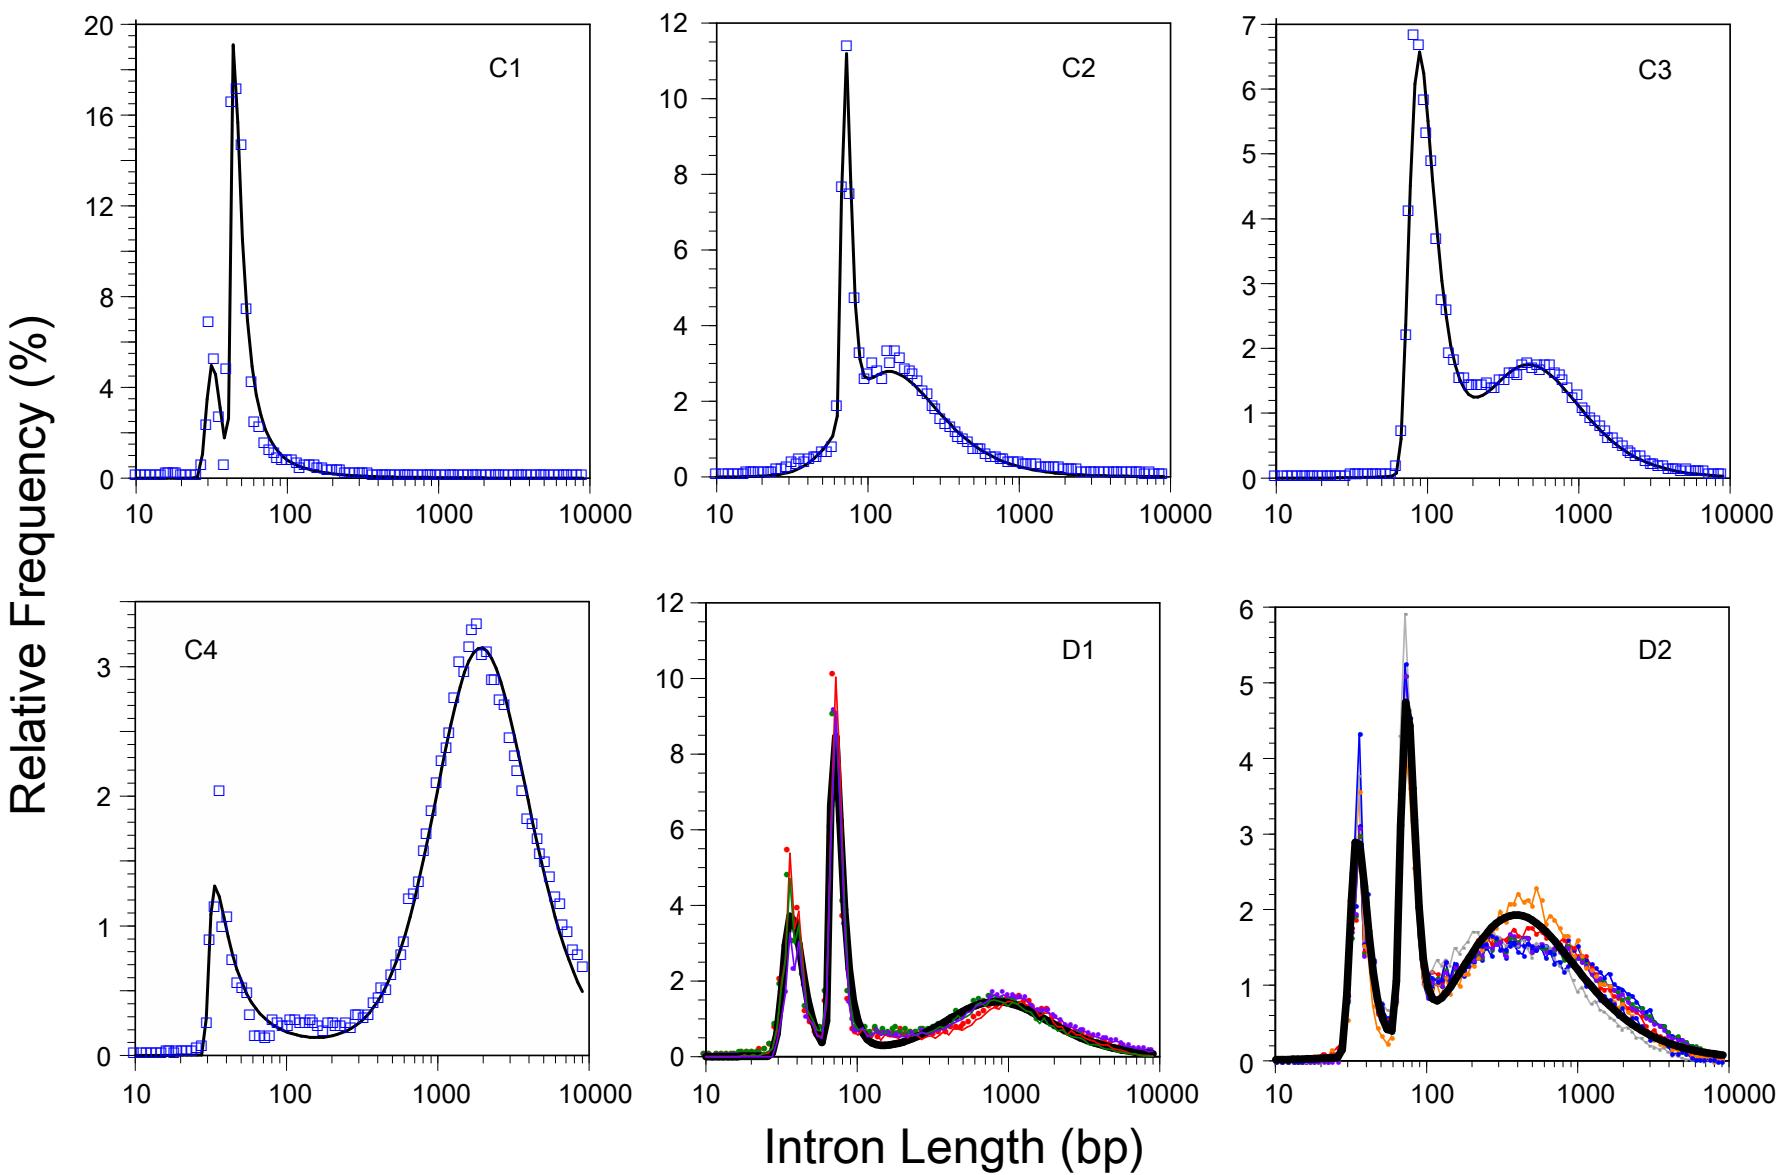

Figure S2. Statistical models (lines) and observed ILDs (marks) of enlarged versions of Figures 1C and 1D. C1: *Dioszegia cryoxerica* (fungus), C2: *Emiliania huxleyi* (protist), C3: *Oryza brachyantha* (plant), C4: *Schistosoma haematobium* (animal), D1: ensemble model of three *Hymenolepis*, D2: ensemble model of six *Taeniidae* plus one *Mesocestoididae* members of tapeworms. In D1 and D2, thick black line represents the model ILD whereas colored thin lines with dots represent individual observed ILDs.

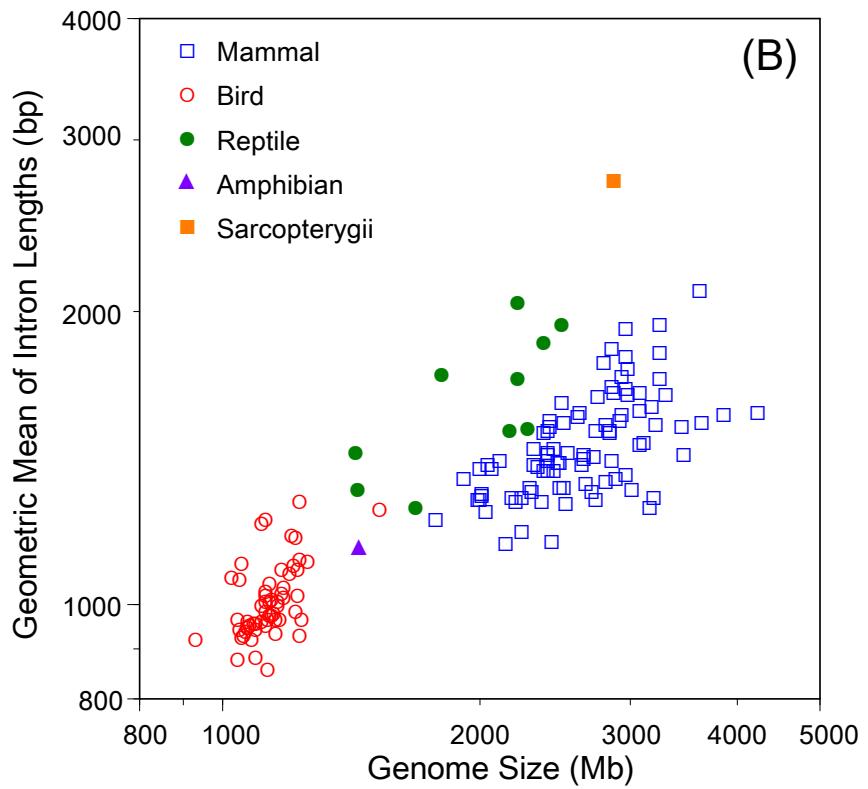

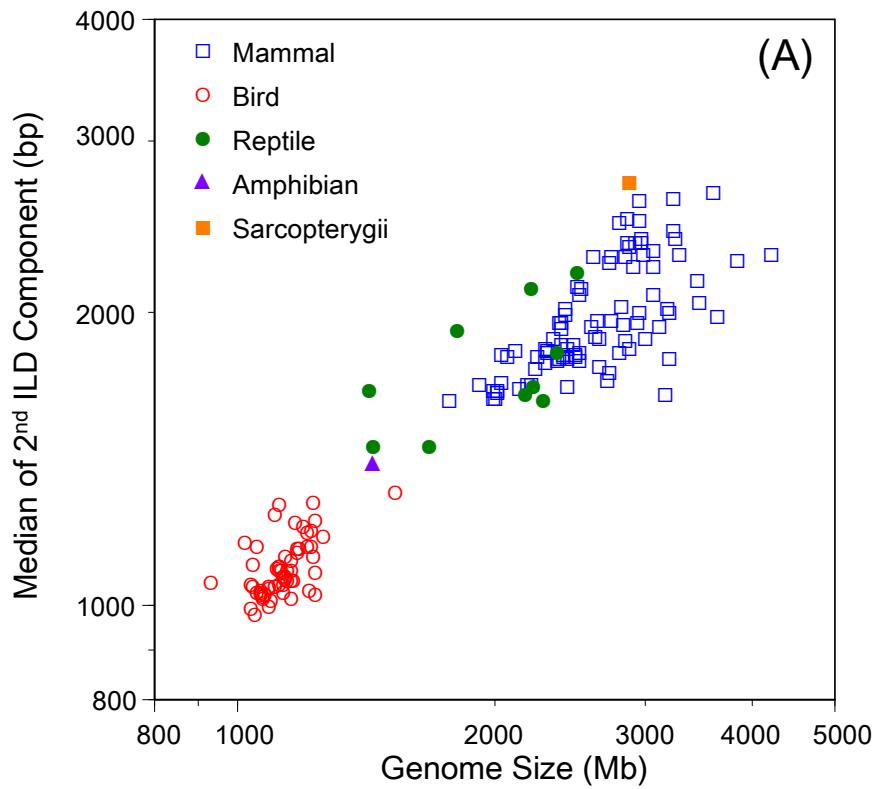

Figure S3. Log-log plot between genome size (X-axis) and representative value of intron lengths (Y-axis) for 161 tetrapods.
(A) Y-axis represents the median of the second component of each two-component ILD model. (B) Y-axis represents the gross geometric mean of each observed ILD.

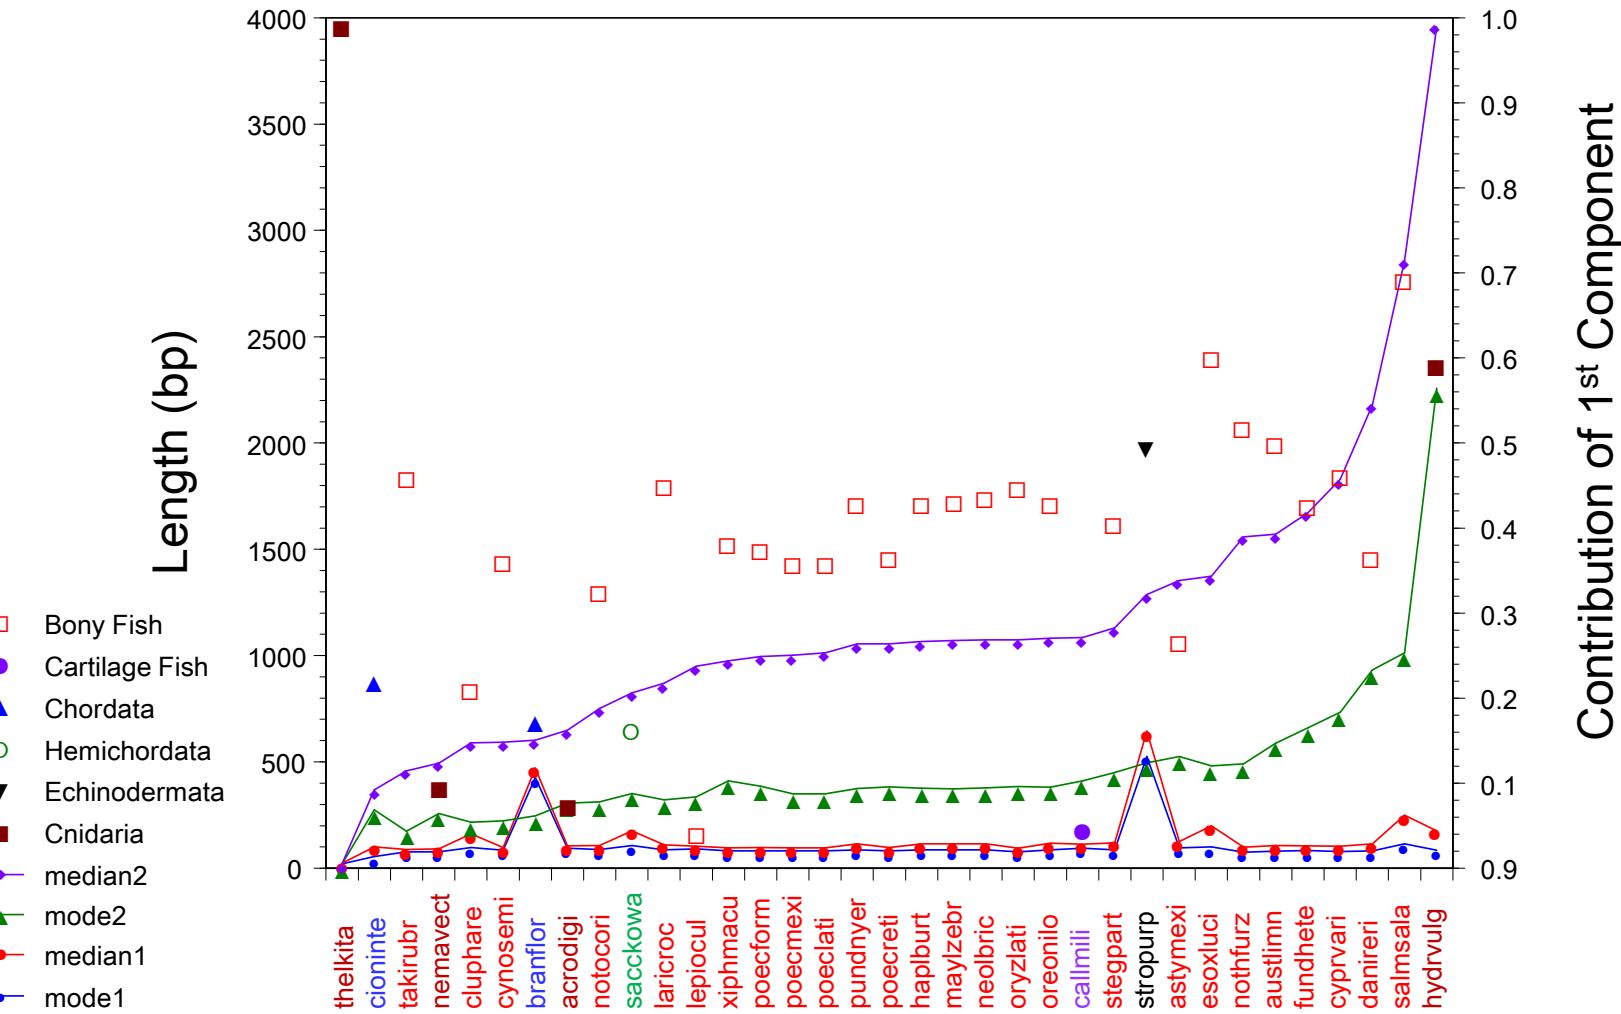

Figure S4. Ildent characteristics of Deuterostomes and *Cnidaria*. The species code and numerical values are listed in Table S3. Taxonomic clades are color coded. Small symbols with connecting lines indicate mode and median of individual ildents. Large symbols indicate the fractional contributions of the first (shorter) ildents.

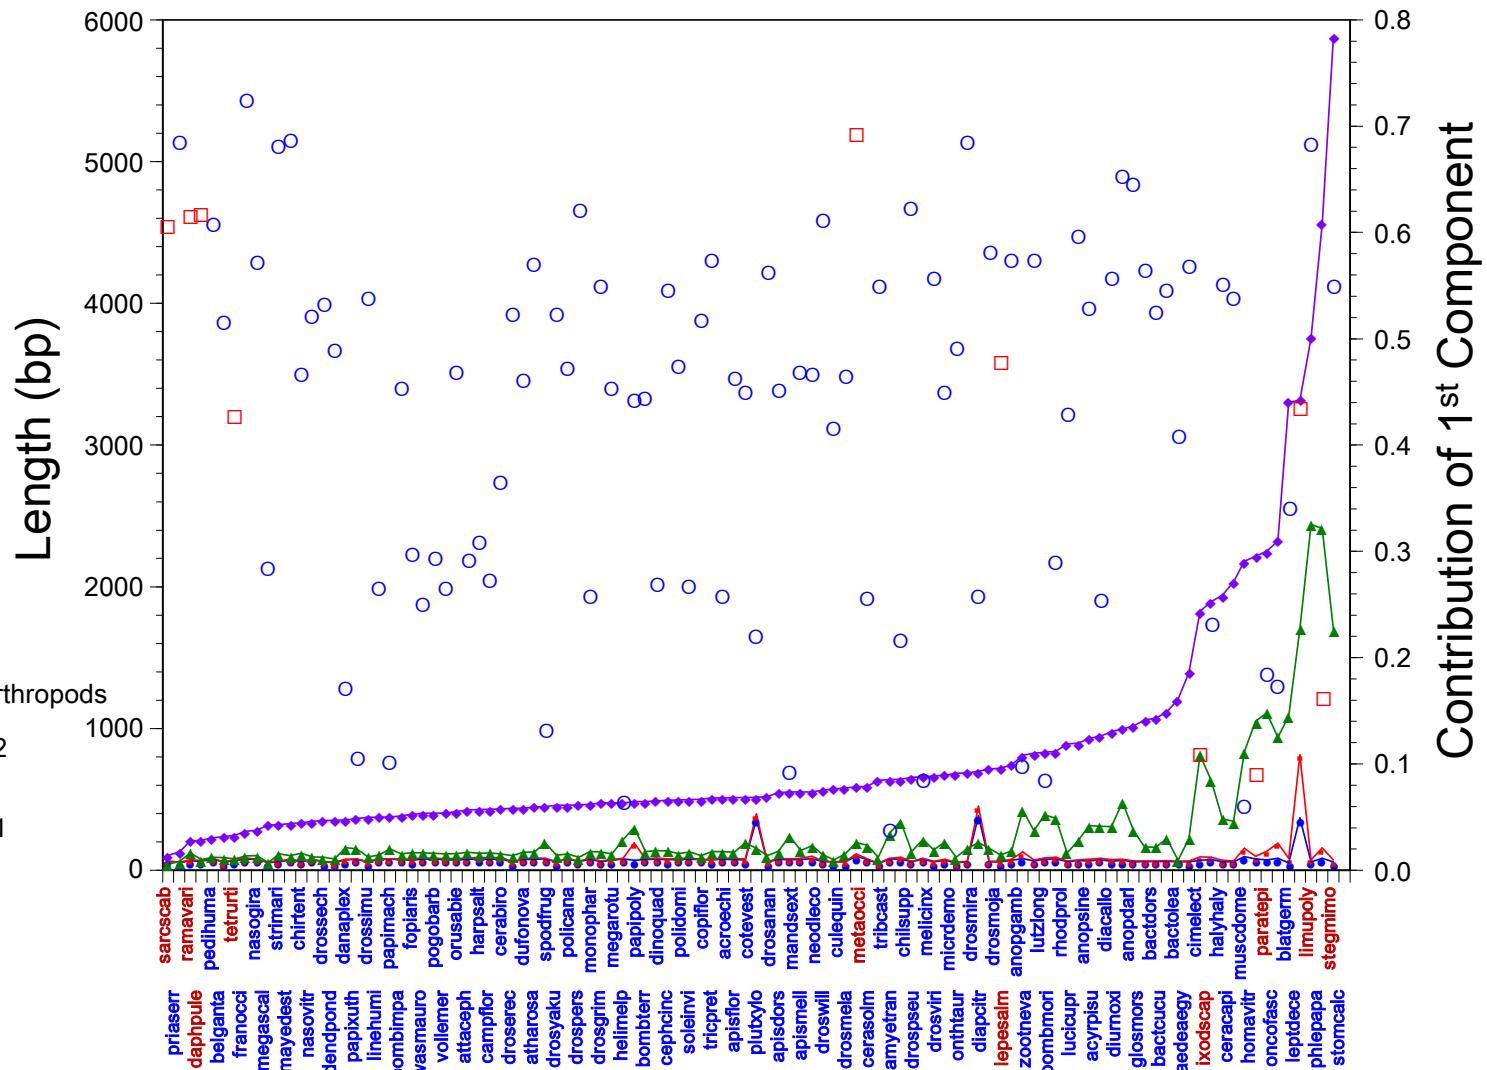

Figure S5. Ildent characteristics of Arthropods. The species code and numerical values are listed in Table S3. Taxonomic clades are color coded. Small symbols with connecting lines indicate mode and median of individual ildents. Large symbols indicate the fractional contributions of the first (shorter) ildents.

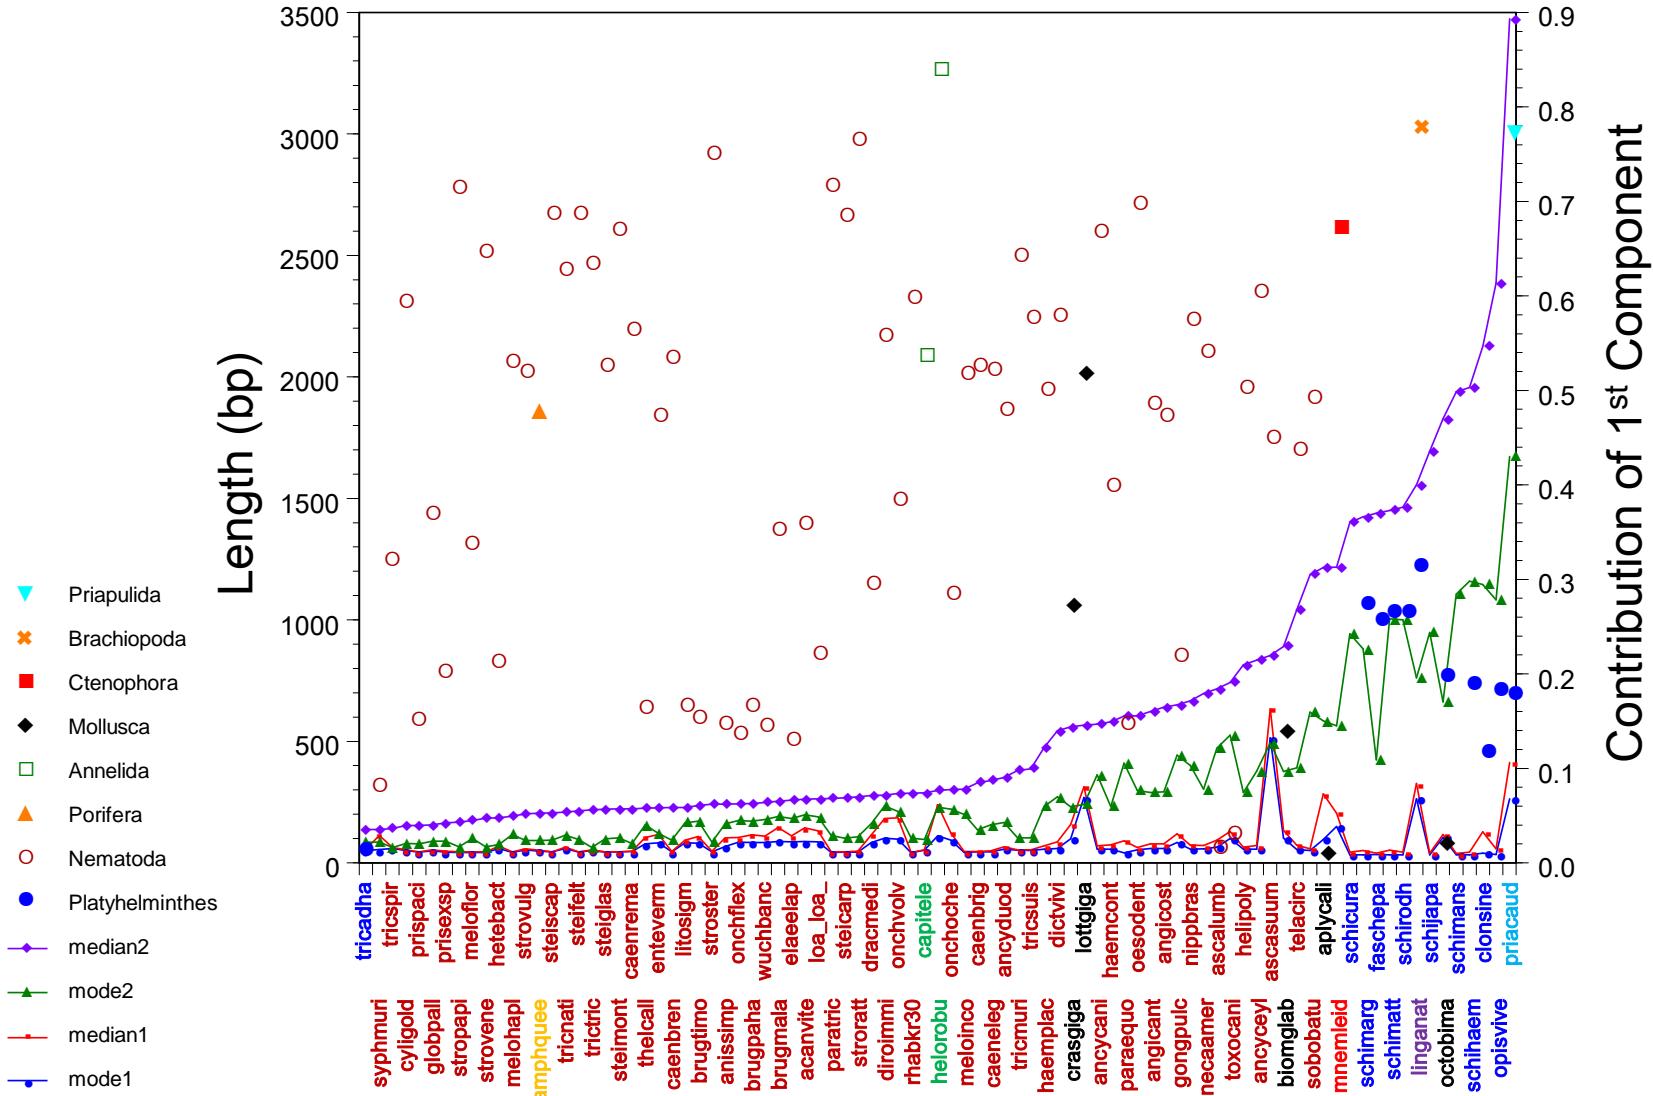

Figure S6. Ildent characteristics of two-component ILDs of miscellaneous metazoans. The species code and numerical values are listed in Table S3. Taxonomic clades are color coded. Small symbols with connecting lines indicate mode and median of individual ildents. Large symbols indicate the fractional contributions of the first (shorter) ildents.

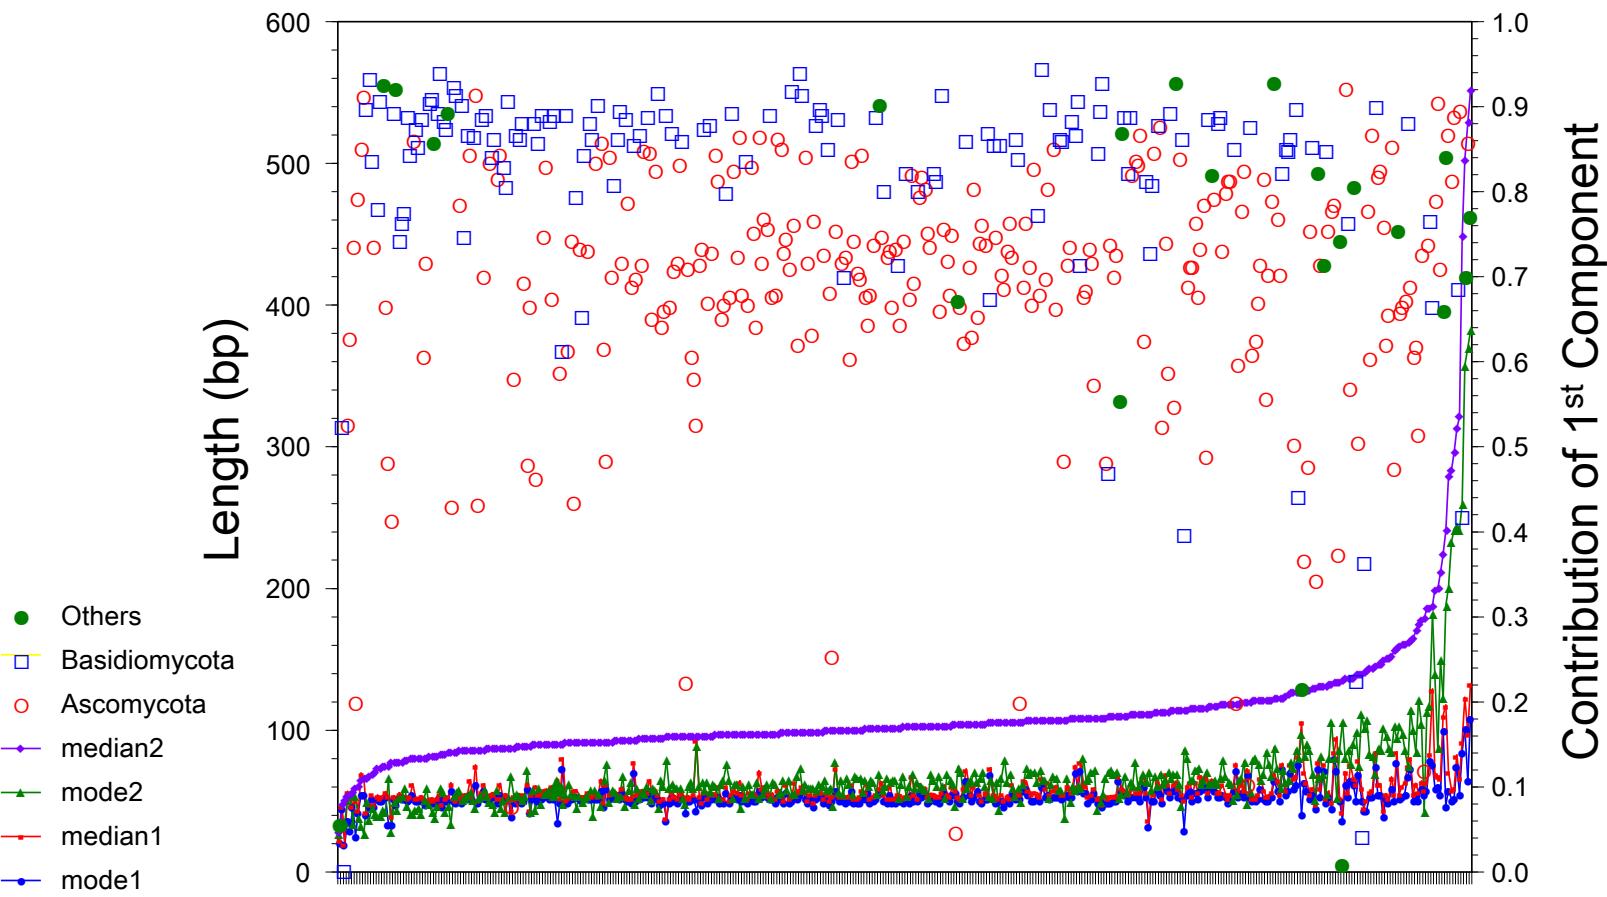

Figure S7. Ildent characteristics of 416 fungi. Numerical values are listed in Table S3. Taxonomic clades are color coded. Small symbols with connecting lines indicate mode and median of individual ildents. Large symbols indicate the fractional contributions of the first (shorter) ildents.

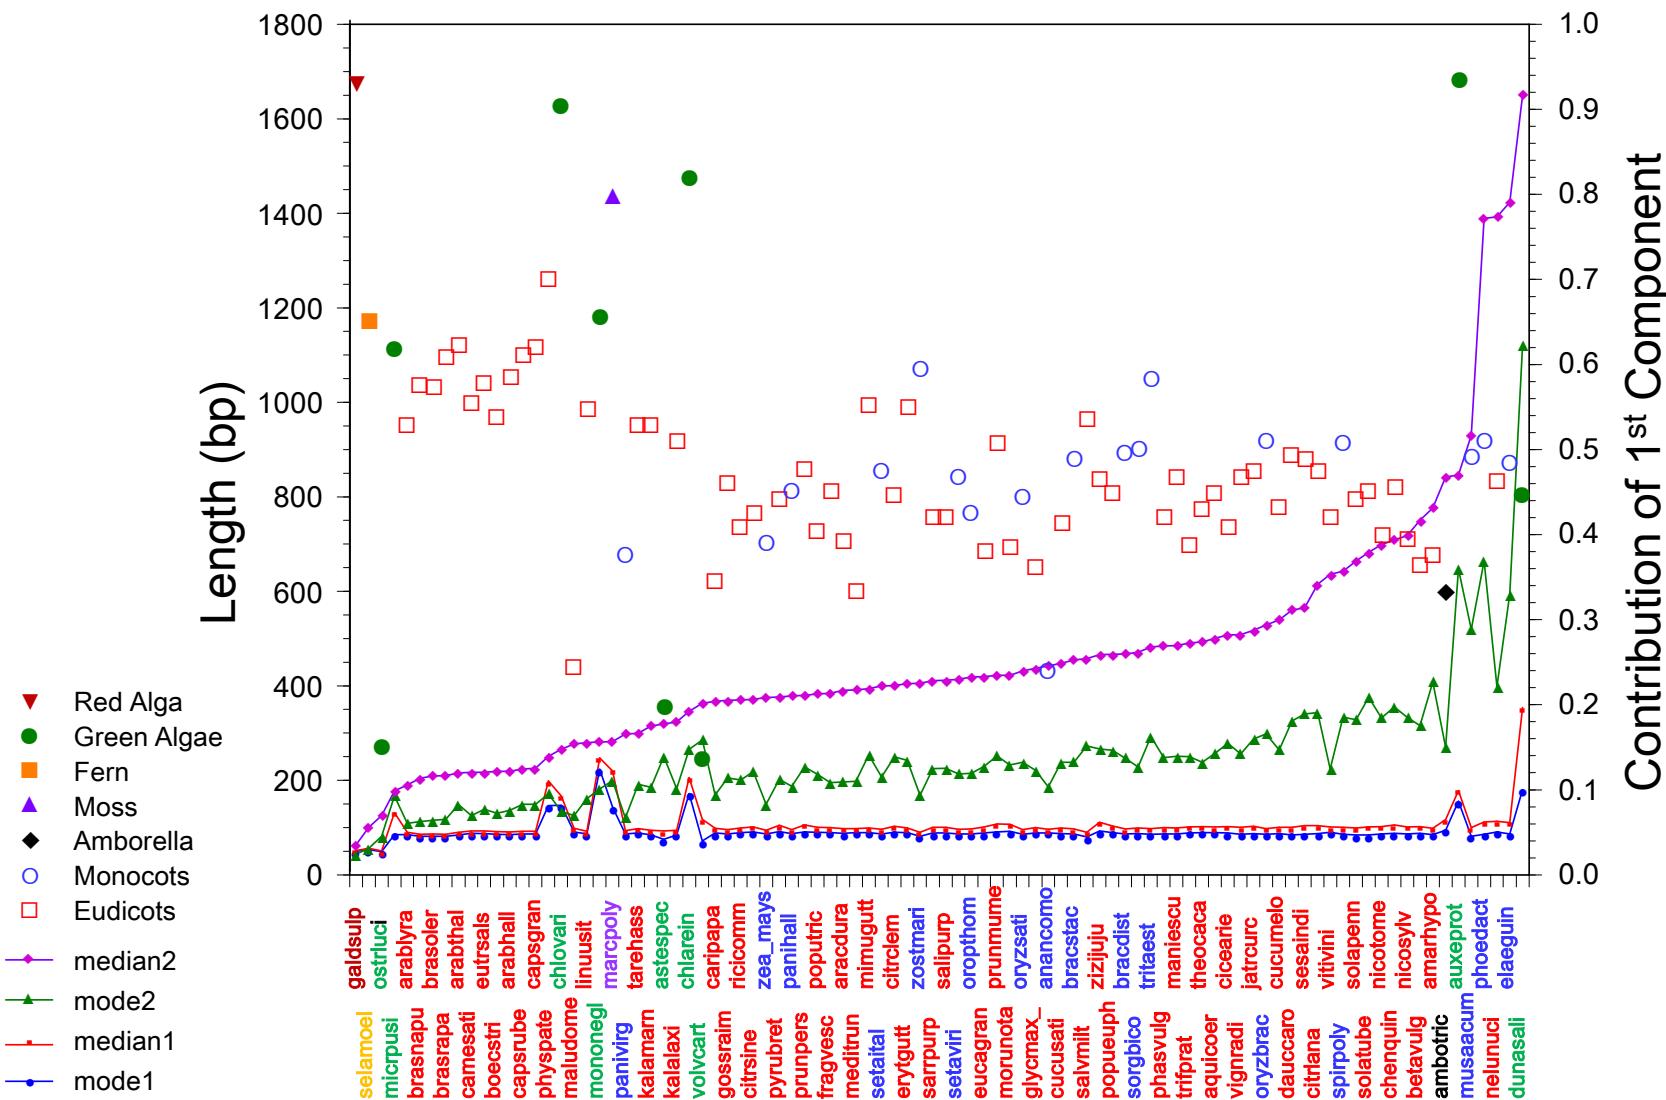

Figure S8. Ident characteristics of Plants. The species code and numerical values are listed in Table S3. Taxonomic clades are color coded. Small symbols with connecting lines indicate mode and median of individual ildents. Large symbols indicate the fractional contributions of the first (shorter) ildents.

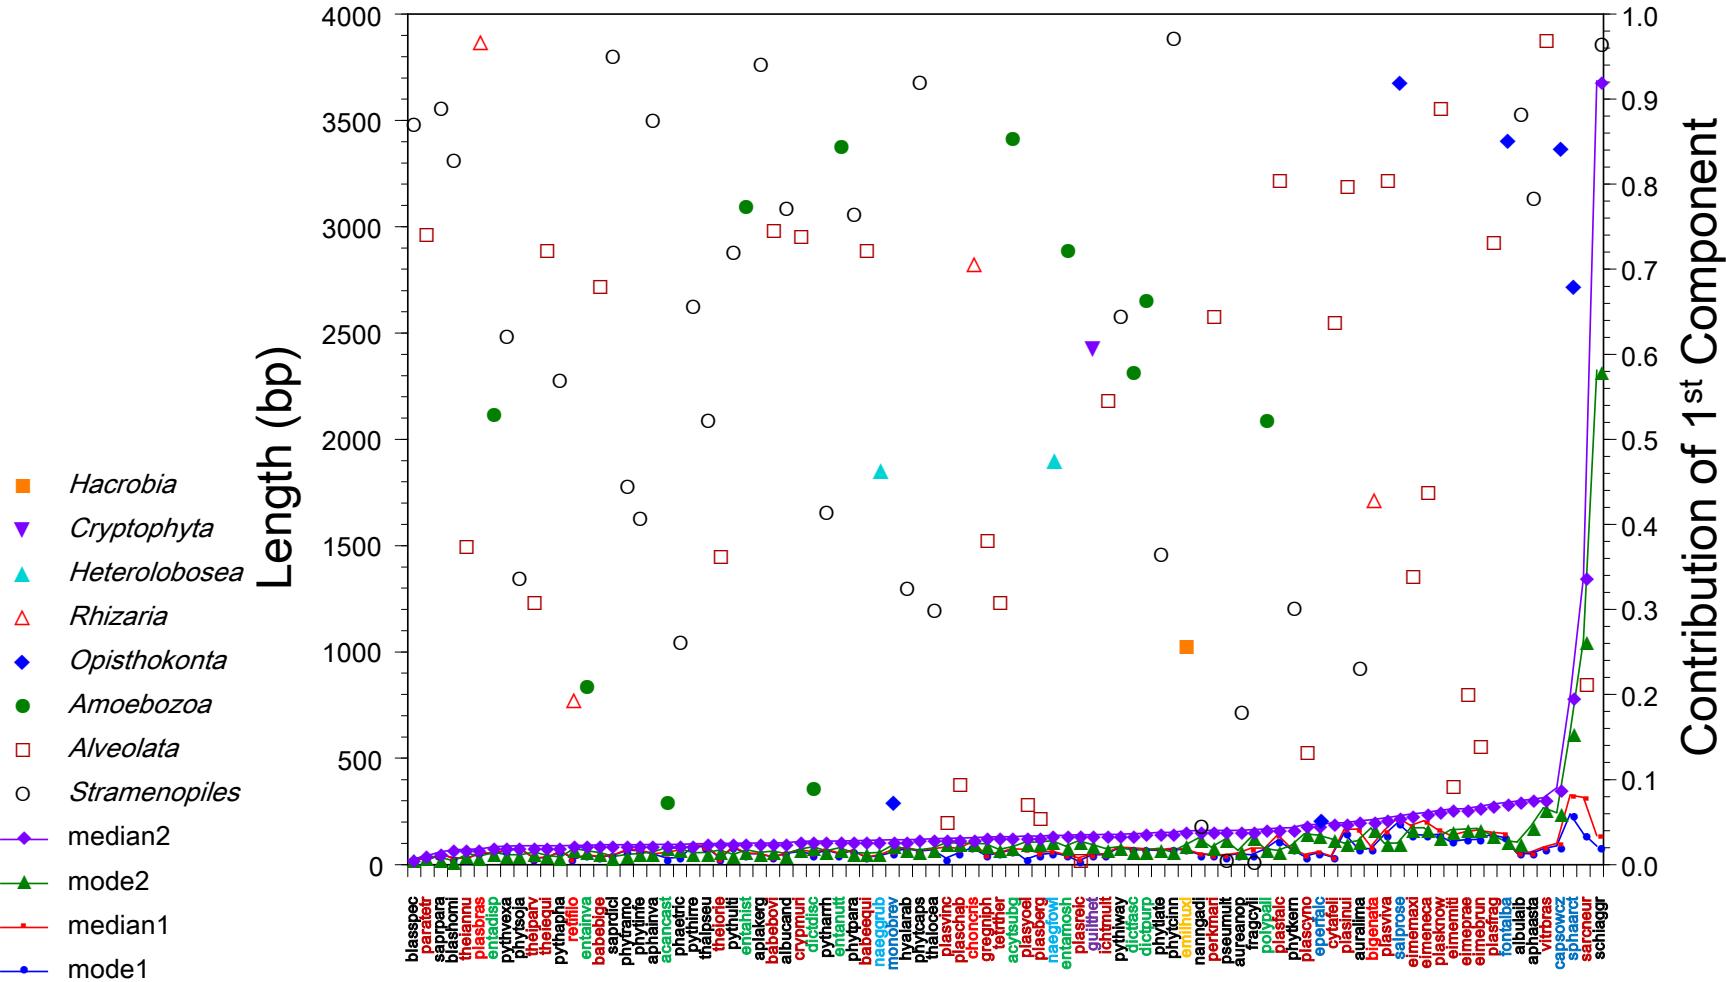

Figure S9. Ildent characteristics of Protists. The species code and numerical values are listed in Table S3. Taxonomic clades are color coded. Small symbols with connecting lines indicate mode and median of individual ildents. Large symbols indicate the fractional contributions of the first (shorter) ildents.

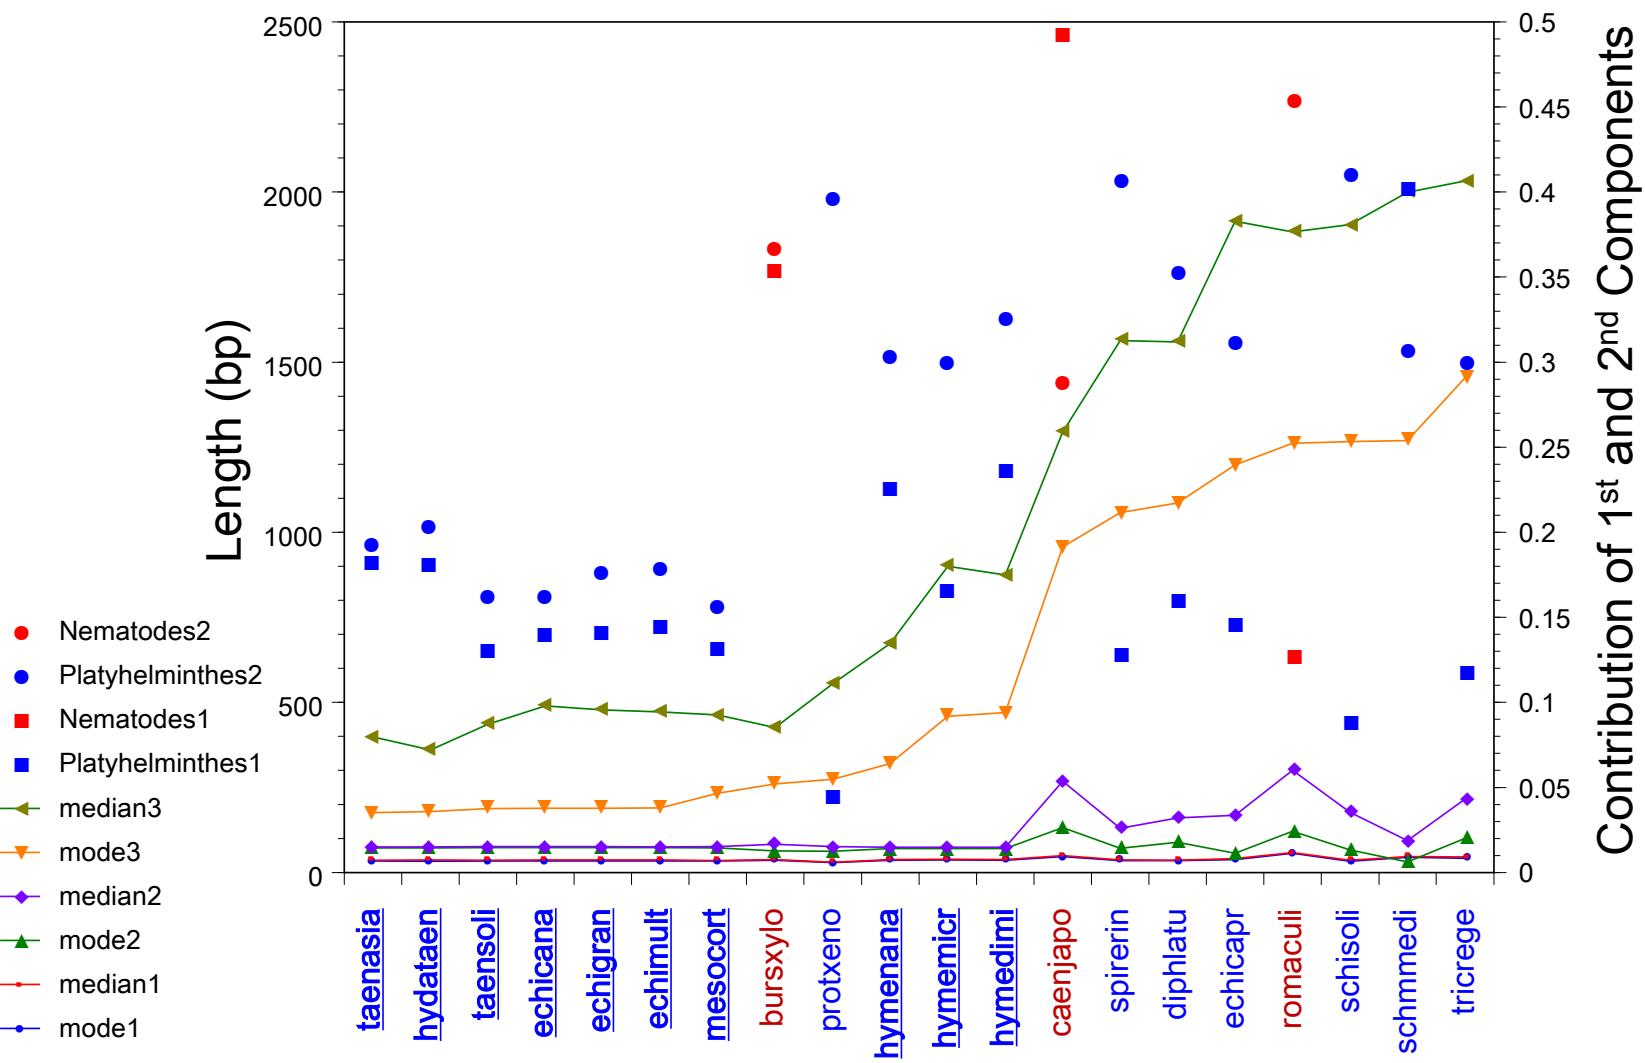

Figure S10. Ildent characteristics of triple modal ILDs. The species code and numerical values are listed in Table S3. Taxonomic clades are color coded. Small symbols with connecting lines indicate mode and median of individual ildents. Large squares and large circles indicate the fractional contributions of the first (shortest) and the second ildents, respectively.

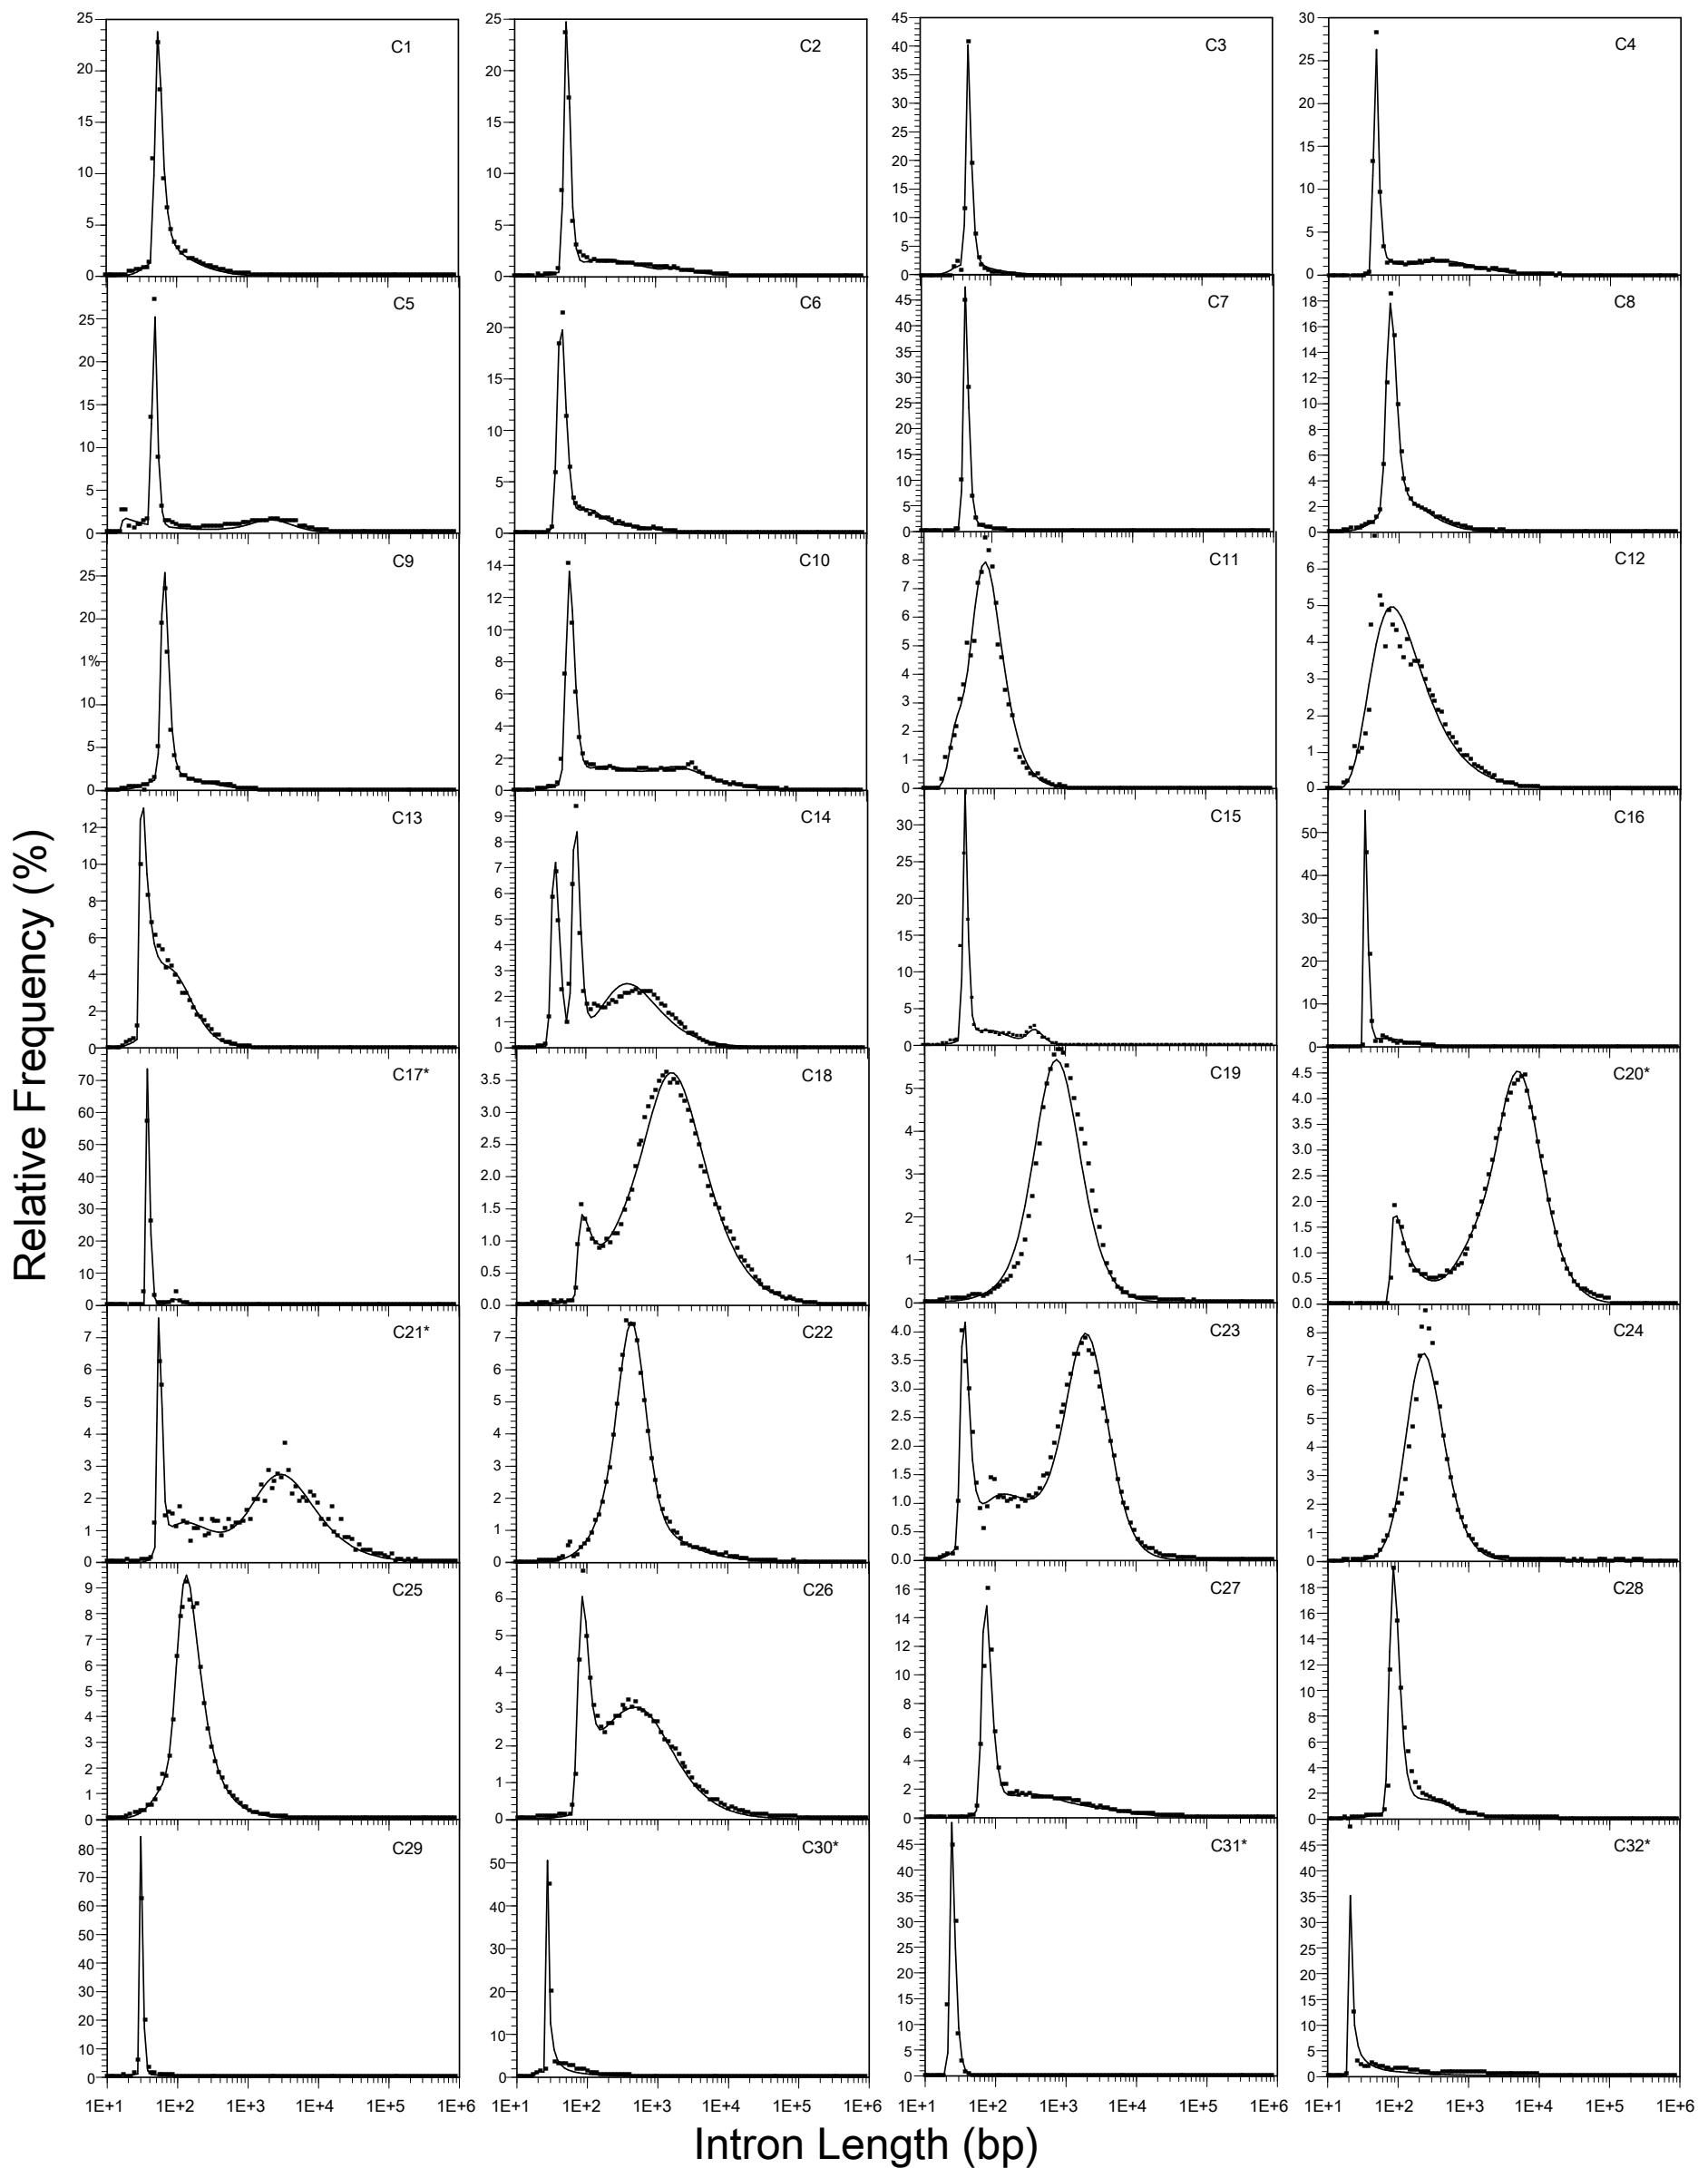

Figure S11. Consensus ILDs of 32 Clusters. Observed ILDs (small boxes) were obtained by sampling introns from the species in the cluster. Statistical models (lines) were obtained with *Fitild* as described in the text. Characteristics of individual consensus ILDs are summarized in Supplementary Table S4. Asterisk indicates singleton cluster.

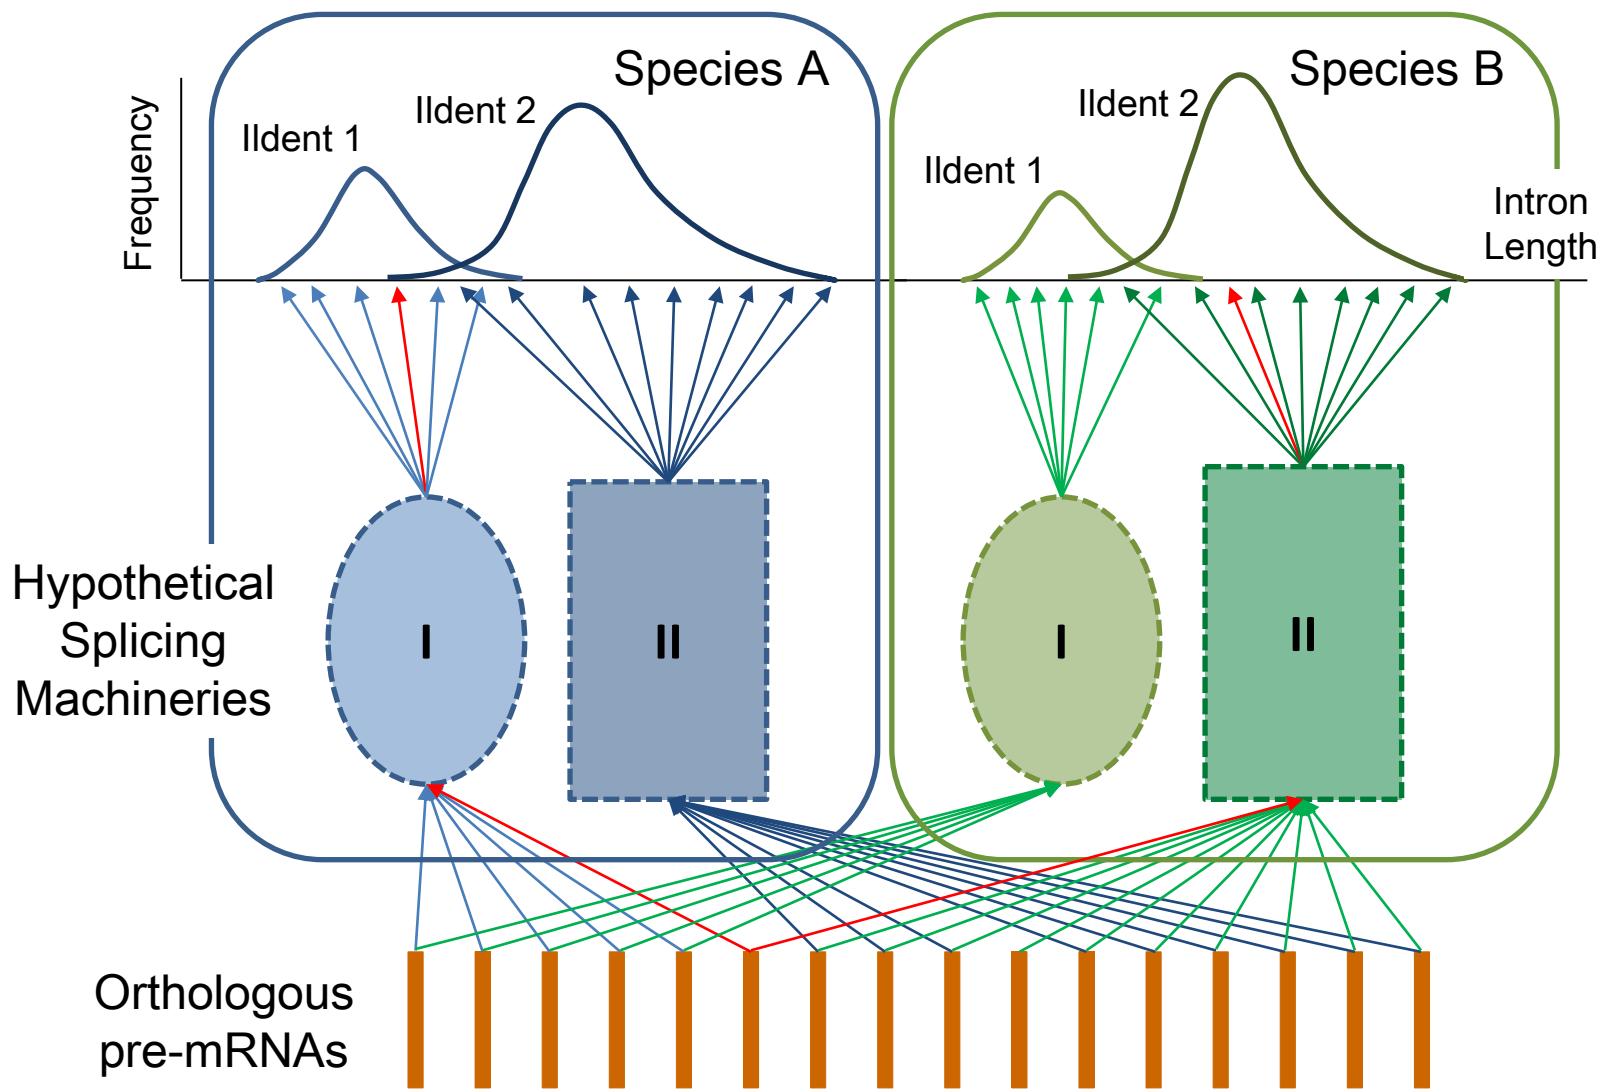

Figure S12. Schematic presentation of the concept of ildents. Orthologous introns in species A and B are processed by either of the conserved hypothetical splicing machineries I or II. An ildent refers to the subset of introns processed by one of the machineries. The ildents processed by the same type of machinery in different species are labeled identically. When the subset of introns is inferred by decomposition of an observed ILD, each component of the ILD may also be called an ildent. Orthologous introns are generally processed by the same type of machineries but rare discordances can occur (red arrows). For simplicity, each pre-mRNA is assumed to have at most one intron.

Supplementary Table S1. Resources of sequence data.
