

Supplemental Fig. 2. The class effect of cytokine assay. The bar graphs show the % of TNF α and IFN γ producing cells stimulated by PMA and IONO with or without each DPP4i (sitagliptin 100 μ M, tenueligliptin 1 μ M, and anagliptin 1 μ M). The data is expressed as mean \pm SD. The experiments were repeated two times. The rate of TNF α and IFN γ producing compared with the control (stimulated by PMA and IONO without DPP4i) is assessed by paired *t* test. NS indicates not significant.
