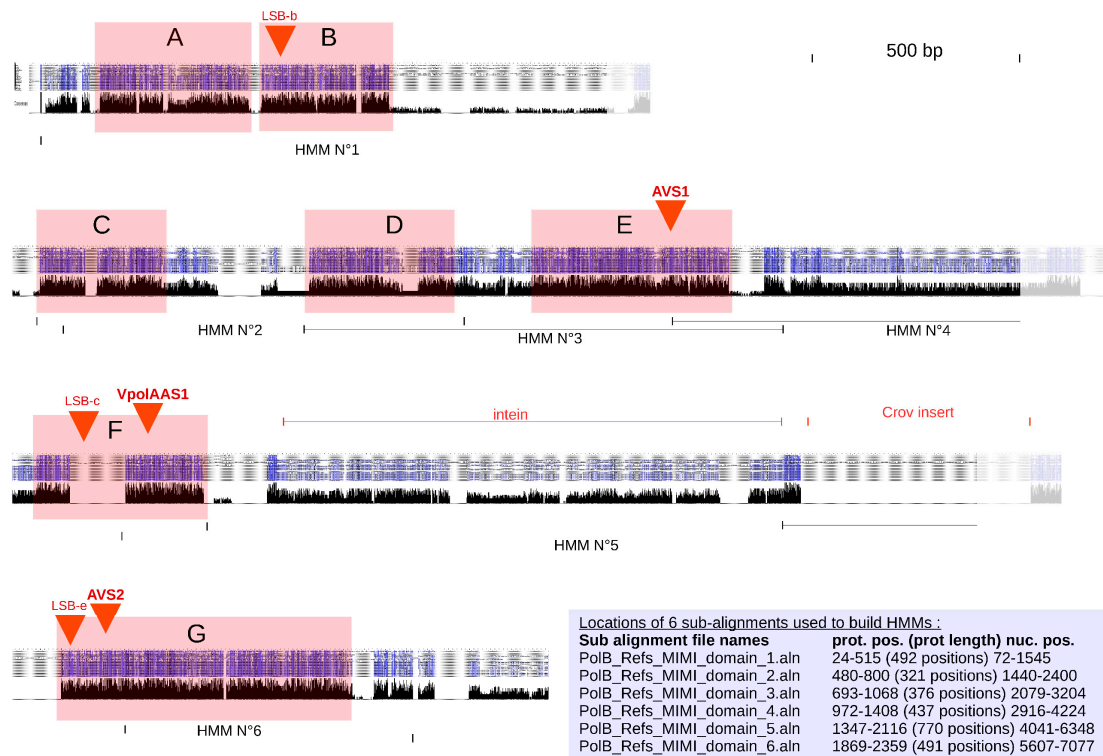

Figure S1. Alignment of 17 ‘Megaviridae’ *polB* reference nucleotide sequences (top blue tracks) with consensus agreement (bottom black histograms). The location of seven conserved domains A-G are indicated by pink boxes, while the position of the six sub-alignments used to build HMM1-6 are indicated by black segments. The position of *polB* primers previously used in the literature are indicated by red triangles (Chen et al. 1995, La Scola et al. 2010, Clerissi et al. 2014), whilst the position of the *polB* intein and large CroV INDEL are indicated by red segments.

Figure S2. *In silico* detection of genomic and metagenomic ‘Megaviridae’ *polBs* by MEGAPRIMER. *In silico* PCR experiments were performed against 21 ‘Megaviridae’ *polBs* (17 references, AaV, BsV, KNV1 and CTV1) and 923 ‘Megaviridae’ *polB* metagenes (921 ‘Megaviridae’-like and 2 OtV-like) from *Tara* Oceans using 82 primer pairs with 10% of maximum mismatches allowed. Rings outside the phylogenetic tree represent primer pairs (PP1 to PP83 from inside to outside). Colored part of the rings indicates positive *in silico* PCR results.

Figure S3. Gel electrophoresis of PCR products. PCR products with visible bands (red labels) were sequenced, while others (white labels) were discarded.

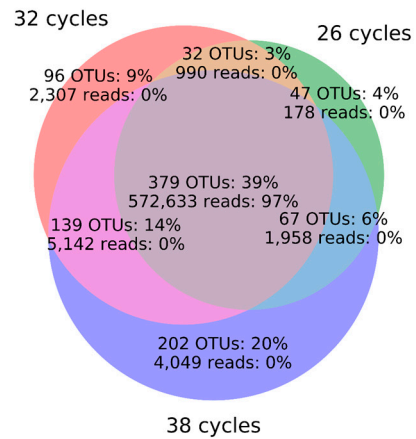

Figure S4. Rarefaction curves for individual primer pairs. This figure shows rarefaction curves for 60 samples for which high quality ‘Megaviridae’ *polB* sequences were generated. Sequences are clustered at 97% DNA identity.

A. All OTUs for PP16

D. All OTUs for PP45

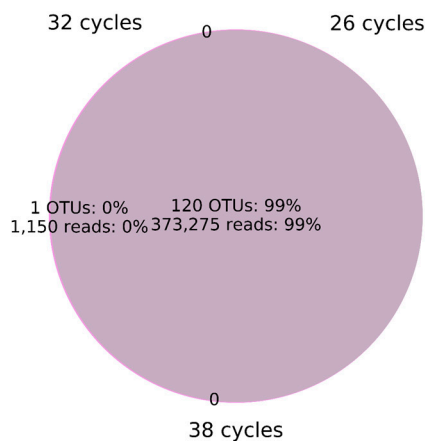

B. Top 500 OTUs for PP16

E. Top 500 OTUs for PP45

C. Top 100 OTUs for PP16

F. Top 100 OTUs for PP45

Figure S5. Number of OTUs shared by different PCR cycles for PP16 (A, B and C) and PP45 (D, E and F). Venn diagrams correspond to those for all OTUs (A, D), top 500 abundant OTUs (B, E) and top 100 abundant OTUs (C, F). OTUs were generated by grouping at 97% DNA sequence identity.

Figure S6. Relationships between read acquisition for OTUs and primer pairs. Same phylogenetic tree as in Figure 5 was used in the central part of the figure. Rings outside the phylogenetic tree represent primer pairs (PP1 to PP83 from inside to outside). Colored part of the rings indicates acquisition of reads for the corresponding primer pairs and OTUs (90% amino acid sequence identity). Reference genomic genes are indicated by the corresponding numbers in Figure 5.

Table S1. Seventeen reference genome sequences used in primer design

Virus name	Access number
<i>Catovirus</i>	KY684084
<i>Klosneuvirus</i>	KY684109
<i>Aureococcus anophagefferens virus</i> isolate BtV-01	NC_024697
<i>Bodo saltans virus</i> strain NG1	MF782455
Organic Lake phycodnavirus 1	HQ704802
Organic Lake phycodnavirus 2	HQ704803
<i>Chrysochromulina ericina virus</i> isolate 01	EU006632
<i>Pyramimonas orientalis virus</i> isolate 01	EU006633
<i>Hirudovirus</i> strain Sangsue	KF493731
<i>Mimivirus</i> Bus strain RTM2	JF979178
<i>Megavirus courdo7</i> isolate Mv13-c7	JN885991
<i>Moumouvirus ochan</i>	JQ063130
<i>Moumouvirus monve</i> isolate Mv13-mv	JN885998
<i>Terra virus</i> 2 TAO-TJA	GU265562
<i>Mimivirus pointerouge1</i> strain Pr1	JF979167
Megavirus lba isolate LBA111	NC_020232
<i>Acanthamoeba polyphaga mimivirus</i>	NC_014649
<i>Megavirus chiliensis</i>	NC_016072
<i>Acanthamoeba polyphaga moumouvirus</i>	NC_020104
<i>Phaeocystis globosa virus</i> strain 16T	NC_021312
<i>Cafeteria roenbergensis virus</i> BV-PW1	NC_014637
