

A

B

C

Dendritic cell maturation status of treated patients. Dendritic cell therapy products in six available cryopreserved cases were tested for maturation/activation 48 hours following maturation induction with polyILCL, IFN α and TNF α . (A) Concentration of indicated cytokines in the DC culture supernatants. Dots represent individual patients color-coded for relapsed and non-relapsed cases. (B) Represents FACS staining for CD11c staining % and MFI. (C) Levels of expression of surface maturation markers.
