| Supplementary Figure 1. Effect of Average Coverage on Sensitivity for Amplicon Data. Average         |
|------------------------------------------------------------------------------------------------------|
| coverage and sensitivity were similar for all replicates with the amplicon-based targeted sequencing |
| panels, with almost all replicates between 220x and 280x coverage. SNP sensitivity was higher than   |
| INDEL sensitivity.                                                                                   |
|                                                                                                      |
|                                                                                                      |
|                                                                                                      |
|                                                                                                      |
|                                                                                                      |
|                                                                                                      |
|                                                                                                      |
