

SUPPLEMENTARY INFORMATION

Correction of cognitive deficits in mouse models of Down syndrome by pharmacological inhibitor of DYRK1A

Thu Lan NGUYEN, Arnaud DUCHON, Antigoni MANOUSOPOULOU, Nadège LOAËC, Benoît VILLIERS, Guillaume PANI, Meltem KARATAS, Anna E MECHLING, Laura-Adela HARSAN, Emmanuelle LIMANTON, Jean-Pierre BAZUREAU, François CARREAUX, Spiros D. GARBIS, Laurent MEIJER and Yann HERAULT

Material and Methods

Synthesis of Leucettines L41, L43 and L99.

Leucettine L41 was prepared as previously described (Debdab et al., 2011)

Leucettine L43 ((5*Z*)-5-(3,4-Dihydro-2*H*-1,5-benzodioxepin-7-ylmethylidene)-2-phenylamino-3,5-dihydro-4*H*-imidazol-4-one). Prepared from 4 equivalents of aniline using the Monowave® 300 Anton-Paar apparatus (reaction time = 30 min., temperature = 140°C, P = 200 Watt) in 52% yield as yellow powder. Mp > 260°C. ¹H NMR (300 MHz, DMSO-*d*₆): δ = 2.08-2.16 (m, 2H, CH₂), 4.17 (t, 4H, *J* = 5.4 Hz, OCH₂), 6.43 (s, 1H, =CH), 6.97 (d, 1H, *J* = 8.1 Hz, Ar), 7.07 (dd, 1H, *J* = 7.2, 7.2 Hz, Ar), 7.37 (dd, 2H, *J* = 8.4, 7.2 Hz, Ar), 7.61 (dd, 1H, *J* = 8.1, 0.9 Hz, Ar), 7.78 (d, 2H, *J* = 8.4 Hz, Ar), 7.85 (d, 1H, *J* = 0.9 Hz, Ar), 9.79 (br s, 1H, NH), 10.65 (br s, 1H, NH). ¹³C NMR (75 MHz, DMSO-*d*₆): δ = 31.4, 70.4, 114.1, 114.2, 119.4, 121.0, 121.5, 122.9, 123.2, 125.9, 128.9, 130.9, 138.8, 150.7, 151.0, 154.8, 170.5. HRMS, *m/z* = 336.1347 found (calculated for C₁₉H₁₈N₃O₃, [M+H]⁺ requires 336.1347). Anal. Calcd for C₁₉H₁₇N₃O₃: C, 68.05; H, 5.11; N, 12.53. Found: C, 67.88; H, 4.88; N, 12.51.

Leucettine L99 ((*Z*)-5-(4-hydroxy-3-methoxybenzylidene)-2-((4-(4-methylpiperazin-1-yl)phenyl)amino)-3,5-dihydro-4*H*-imidazol-4-one). Prepared from 1,1 equivalents of aniline using the Monowave® 300 Anton-Paar apparatus (reaction time = 30 min., temperature = 140°C, Pmax = 200 Watt) in 23% yield as green-yellow powder. Mp > 260°C. ¹H NMR (300 MHz, DMSO-*d*₆) δ 2.22 (s, 3H, CH₃), 2.46 (t, *J* = 5.2 Hz, 4H), 3.09 (t, *J* = 4.9 Hz, 4H), 3.86 (s, 3H, CH₃), 6.39 (s, 1H), 6.78 (d, *J* = 8.1 Hz, 1H), 6.95 (m, 2H), 7.18 (dd, *J* = 8.6, 1.8 Hz, 1H), 7.68 (d, *J* = 8.6 Hz, 2H), 8.22 (d, *J* = 1.8 Hz, 1H), 9.47 (br s, 1H, NH), 10.51 (br s, 1H, NH). ¹³C NMR (300 MHz, DMSO-*d*₆) δ 46.22, 49.05, 55.10, 55.63, 113.41, 115.33, 115.76, 116.16, 120.81, 125.04, 127.74, 131.35, 138.72, 147.42, 147.90, 154.26, 170.81. HRMS, *m/z* = 408.2037 found (calculated for C₂₂H₂₆N₅O₃, [M+H]⁺ requires 408.20356). Anal. Calcd for C₂₂H₂₅N₅O₃: C, 64.85; H, 6.18; N, 17.19. Found: C, 64.03; H, 6.02; N, 17.01.

Detailed rsfMRI analysis

All animal experiments were performed in accordance with the guidelines and ethics on animal experimentation established by the German and French laws (ethical allowance 35_9185.81/G-13/15 from Regierungspräsidium Freiburg). Animal preparation, data acquisition and analysis were performed as described previously (Mechling et al., 2016). In brief, resting state magnetic resonance imaging (rsfMRI) was performed on 26 animals separated in 4 groups: wild type saline treated (Wild type – Saline); Wild Type – L41 treated mice; DP16 – Saline treated and DP16 – L41 treated. RsfMRI was carried out under medetomidine sedation (sc bolus injection, 0.3 mg per kg body weight in 100 µL 0.9% NaCl-solution right before the scan followed by continuous sc infusion of medetomidine (0.6 mg per kg body weight in 200 µL per hour) during scanning). The physiological parameters including body temperature, respiration rate, blood oxygen saturation and heart rate were continuously monitored to ensure stable and comparable imaging conditions for all animals. RsfMRI data was collected using single shot gradient echo EPI (TE/TR = 10 ms/1700 ms) at a 7 T small bore animal scanner (Biospec 70/20, Bruker, Germany) with a mouse head adapted cryocoil (MRI CryoProbe, Bruker, Germany). Following a shimming protocol, the whole mouse brain (excluding the cerebellum) was covered using

24 axial slices (0.7 mm slice thickness), with a field of view of $1.92 \times 1.2 \text{ cm}^2$ and an acquisition matrix of 128×80 . This resulted in a planar spatial resolution of $150 \times 150 \mu\text{m}^2$. 200 volumes were recorded with slice acquisition in interlaced fashion for each run. The preprocessing pipeline including coregistration with Allen mouse brain atlas (AMBA), creation of brain mask and smoothing with a Gaussian kernel of FWHM $0.4 \times 0.4 \times 1 \text{ mm}^3$ was performed using MATLAB and SPM8 (<http://www.fil.ion.ucl.ac.uk/spm/>).

Seed-based correlation analysis: To evaluate the alterations of functional networks, several brain areas were selected as the regions of interest (ROIs). As all the data was normalized onto AMBA, each ROI was extracted using this atlas and used as seed region to perform FC analysis of the pre-processed rsfMRI data. Correlation coefficients were then computed (two-tailed t-test, $p < 0.001$) between the seed region and the averaged time series of the remaining whole brain for each group and were converted to z values using Fisher's r-to-z transformation. Statistical evaluation of the impact of L41 treatment on the FC was performed via group two-tailed t-test ($p < 0.01$), comparing wild type L41 treated animals versus saline treated wild type animals (WT L41 vs WT Sal) as well as DP16 - L41 treated animals versus Saline treated DP16 animals (DP16 L41 vs DP16 Sal). Included ROIs were: RSP: retrosplenial cortex to map the default mode network; CA1; Dentate gyrus; Perirhinal cortex and Anterior Cingulate area (ACC).

Assay of recombinant protein kinases

Kinase activities for each enzyme were assayed in Buffer A (10 mM MgCl_2 , 1 mM EGTA, 1 mM dithiothreitol, 25 mM Tris-HCl pH 7.5, 50 μg heparin/mL) or Buffer B (50 mM MgCl_2 , 90 mM NaCl, 30 mM Tris-HCl pH 7.4), with their corresponding substrates, in the presence of 15 μM ATP in a final volume of 30 μL . After 30 min incubation at 30°C , the reaction was stopped by harvesting, using a FilterMate harvester (Packard), onto P81 phosphocellulose papers (GE Healthcare) which were washed in 1% phosphoric acid. 20 μL of scintillation fluid were added and the incorporated radioactivity measured in a Packard counter. Blank values were subtracted and activities calculated as pmoles of phosphate incorporated during the 30 min incubation. Controls were performed with appropriate dilutions of dimethylsulfoxide (DMSO). Kinase activities were expressed in % of maximal activity, i.e. in the absence of inhibitors. IC_{50} values were obtained from the dose-response curves.

CDK1/cyclin B (M phase starfish oocytes, native, affinity purified), *CDK2/cyclin E* (human, recombinant, from A. Echalier), *CDK5/p25* (human, recombinant, expressed in *E. coli*) were assayed in Buffer A (supplemented extemporaneously with 0.15 mg BSA/mL, except for CDK2) with 25 μg of histone H1. *CDK9/cyclinT* (human, recombinant, expressed in insect cells) were assayed as described for CDK1/cyclin B, but using 8.07 μg of CDK7/9-Tide (YSPTSPSYSPSPSYSPSPSKKKK). *DYRK1A, 1B, 2, 3* (human, recombinant, expressed in *E. coli* as GST (glutathione S-transferase) fusion proteins), and *CLK1, 2, 3, 4* (mouse, recombinant, expressed in *E. coli* as GST fusion proteins) were assayed in Buffer A (supplemented extemporaneously with 0.15 mg bovine serum albumin (BSA)/mL) with 1 μg of RS peptide (GRSRRSRSRSR) as a substrate. *GSK-3 α/β* (glycogen synthase kinase -3, porcine brain, native, affinity purified on axin-sepharose beads), was assayed using a GSK-3 specific substrate (GS-1: YRRAAVPPSPSLSRHSSPHQpSEDEEE where pS stands for phosphorylated serine). *Pim1* (human, recombinant, expressed in *E. coli*) were assayed as described for DYRK1A with 25 μg of histone H1 as a substrate. *Casein kinase 2 (CK2)* (human, recombinant, obtained from C. Cochet) was assayed in Buffer B, with 7.79 μg of peptide substrate 29 (RRREDEESDDEE).

CNR1 receptor antagonism assay

The DiscoverX PathHunter β -arrestin assay monitors the activation of a GPCR in a homogenous, non-imaging assay format using the Enzyme Fragment Complementation (EFC) technology with β -galactosidase (β -Gal) as the functional reporter. The enzyme is split into two inactive complementary portions (EA for Enzyme Acceptor and ED for Enzyme Donor) expressed as fusion proteins in the cell. EA is fused to β -Arrestin and ED is fused to the GPCR of interest, in this case the cannabinoid receptor CNR1. Dose-response curves were carried out on CNR1, in the presence of its agonist CP55940, for the three Leucettines L41, L43, L99 and IC_{50} values were determined. For antagonist assays, data was normalized to the maximal and minimal response observed in the presence of EC80 ligand and vehicle. An EC80 of 32 nM CP55940 was used. The effects of Leucettines are reported as % inhibition of fully activated CNR1 receptor by CP55940.

DYRK1A and GSK-3 β mRNA levels

Total mRNAs were isolated from mice Tg(*Dyrk1a*) and Ts65Dn brain tissues using the RNeasy Plus kit (Qiagen, Hilden, Germany) according to the manufacturer's protocol. Total RNA (727ng) was reverse transcribed by the SuperScript III first strand synthesis kit (#18080-051 Invitrogen) in accordance with the manufacturer's instructions. mRNA expression profiles were analysed by real-time quantitative PCR using SsoFast EvaGreen Supermix (#172-5204 Bio-Rad) in a CFX96TM Touch real-time PCR detection system (Bio-Rad). Primers used for the detection of *Gsk-3 β* , *Dyrk1a*, genes and housekeeping gene *Rplp0* are listed in Table (Eurofins, Ebersberg, Germany). The complete reactions were subjected to the following program of thermal cycling: 1 cycle of 30 seconds at 95°C; 50 cycles of 5 seconds at 95°C and 5 seconds at 59°C. A melting curve was run after the PCR cycles, followed by a cooling step. Each sample was run in triplicate in each experiment. Expression level of *Dyrk1a* is normalized to the expression level of *Gsk-3 β* and *Tbp*.

Phosphoproteomics, methods and analysis of results

In-solution Proteolysis and iTRAQ labeling. Specimens were vortexed in 0.5 M triethylammonium bicarbonate (TEAB), 0.05% sodium dodecyl sulfate (SDS) and pulsed probe sonicated (Misonix, Farmingdale, NY, USA). The resulting lysates were then centrifuged (16,000 g, 10 min, 4°C) and supernatants were measured for protein content using infrared spectrometry (Direct Detect, Millipore, Merck KGaA, Darmstadt, Germany). An equivalent of 100 μ g total protein from each specimen was subjected to reduction, alkylation, trypsin proteolysis and isobaric tags for relative and absolute quantitation (iTRAQ) labeling per supplier's specifications (ABSciex, San Jose, CA, USA). The following iTRAQ specimen labeling assignment was used: 113 \cong Ts65 T control; 114 \cong Ts65 T 41; 115 \cong Ts65Dn control; 116 \cong Ts65Dn 41; 117 \cong Tg(*Dyrk1a*) T control; 118 \cong Tg(*Dyrk1a*) T 41; 119 \cong Tg(*Dyrk1a*) control, and 121 \cong Tg(*Dyrk1a*) 41. The eight iTRAQ labeled specimens were pooled and lyophilized to dryness.

Hydrophilic interaction chromatography (HILIC) Peptide Fractionation. The pooled specimen was reconstituted in 100 μ L solution of 70% acetonitrile / 30% H₂O with 10 mM formic acid and subjected to high-performance HILIC separation (150-mm \times 2.1 mm ID, 2.6 μ m particle, Core-shell, Kinetex, Phenomenex, Torrance, CA, USA) at a flow rate of 200 μ L/min and column temperature at 35°C. The multi-step gradient separation scheme was as follows : 10 min isocratic at 100% mobile phase A (70% acetonitrile / 30% H₂O with 10mM formic acid), linear gradient for 80 min to 40% mobile phase B (100% H₂O, 10 mM formic acid), second linear gradient for 30 min to 95% mobile phase B, isocratic for 10 min at 95% mobile phase B and linear gradient for 10 min gradient to 5% mobile phase B. Fractions were collected in a peak dependent manner as recorded at 218 nm signal response. A total of 50 fractions were collected, lyophilized to dryness, and stored at -20 °C until LC-MS analysis.

LC-MS analysis. The LC-MS experiments were performed on the Dionex Ultimate 3000 UHPLC system coupled with the high resolution nanospray LTQ-FT-Orbitrap Elite mass spectrometer (Thermo Scientific, Bremen, Germany). Each peptide fraction was reconstituted in 30 μ L loading solution (2% acetonitrile, 0.1% formic acid) and a 10 μ L volume was loaded on the Acclaim PepMap 100, 100 μ m ID \times 2 cm C18, 5 μ m particle, 100 Å pore) trapping column with the μ PickUp Injection mode. The loading pump flow rate was 5 μ L/min and samples were loaded on the trapping column for 8 min. The analytical peptide separation was performed with low pH C₁₈ Reverse Phase capillary ultra performance liquid chromatography (Acclaim PepMap, 75 μ m ID \times 50 cm, 2 μ m particle, 100 Å pore, San Jose, CA, USA) at a flow rate of 300 n /min and column temperature at 50°C retrofitted. The multi-step gradient elution scheme was as follows : Isocratic at 100% mobile phase A (2% acetonitrile, 0.1% formic acid) ; linear gradient for 120 min to 85% mobile phase B, (100% acetonitrile, 0.1% formic acid), Isocratic at 85% mobile phase B for 5 min, and 100% mobile phase A, in 10 min. Nanospray ionization of eluted peptides was performed with metal coated silica

emitters (FS360-20-10-D-20-C7, New Objective, Woburn, MA, USA). Gaseous phase transition of the peptides was performed with positive ion electrospray ionization applying a voltage of 2.5 kV. Top 7 multiply charged precursors within 350 -1900 m/z and intensity threshold 500 counts were selected with FT mass resolution of 120,000 and isolated for both CID and HCD fragmentation within mass windows of 2 and 1.2 Da respectively. Normalized collision energy was set at 35 for the CID spectra and 40 for the HCD spectra that were acquired with FT resolution of 15,000 within a m/z range of 100-1900. Already targeted precursors were dynamically excluded for further isolation and activation for 30 sec with 10 ppm mass tolerance.

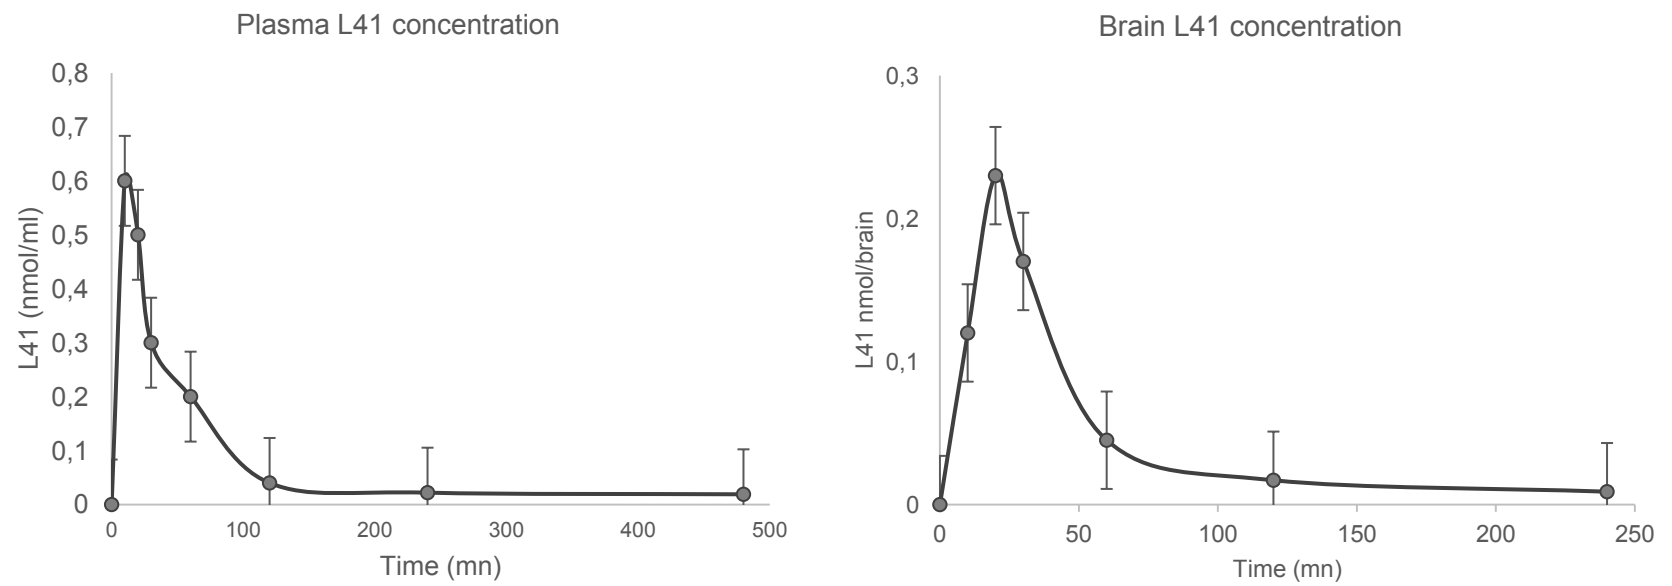

Protein Identification and Quantification. All tandem mass spectra were submitted to Sequest search engine implemented on the Proteome Discoverer software version 1.4 for peptide and protein identifications. All spectra were searched against an updated UniProt Fasta file containing 20,200 human reviewed entries. The Sequest node for the HCD spectra included the following parameters: Precursor Mass Tolerance 10 ppm, Fragment Mass Tolerance 20 mmu, Dynamic Modifications were Oxidation of M (+15.995 Da), Deamidation of N, Q (+0.984 Da), Phosphorylation of S (+79.966 Da) and Static Modifications were iTRAQ8plex at any N-Terminus, K, Y (+304.205 Da) and Methylthio at C (+45.988 Da). The Fragment Mass Tolerance for the CID spectra was 0.5 Da while search for phosphorylation was not included. The level of confidence for peptide identifications was estimated using the Percolator algorithm with decoy database searching. Strict FDR was set to 0.01, relaxed FDR was set to 0.05 and validation was based on q-Value. The Reporter Ion Quantifier node included a custom iTRAQ 8plex (Thermo Scientific Instruments) Quantification Method, integration window tolerance of 10 ppm with Most Confident Centroid. Protein ratios were normalized to protein median and phosphorylation localization probability was estimated with the phosphoRS node. Only uniquely occurring peptides were used for protein relative quantification and peptides with missing iTRAQ channels were excluded.

Phosphoproteomics analysis results. A total of about 70 tryptic peptide fractions were analyzed from each brain region. Only phosphoproteins identified at $\geq 99\%$ confidence (peptide FDR $\leq 1\%$, $q < 0.01$ based on decoy search) were accounted for. The cortex, cerebellum, and hippocampus regions reproducibly profiled a total of 1,199, 1,507, and 996 unique phosphoproteins, respectively. The mass spectrometry proteomics data have been deposited to the ProteomeXchange Consortium (<http://proteomecentral.proteomexchange.org>) via the PRIDE partner repository with the data set identifier PXD000XXX (Griss et al., 2013; Hermjakob & Apweiler, 2006; Csordas et al., 2013).
