

Supplemental Information

Mode of Action of Kanglemycin A, an Ansamycin

Natural Product that Is Active against

Rifampicin-Resistant *Mycobacterium tuberculosis*

Hamed Mosaei, Vadim Molodtsov, Bernhard Kepplinger, John Harbottle, Christopher William Moon, Rose Elizabeth Jeeves, Lucia Ceccaroni, Yeonoh Shin, Stephanie Morton-Laing, Emma Claire Louise Marrs, Corinne Wills, William Clegg, Yulia Yuzenkova, John David Perry, Joanna Bacon, Jeff Errington, Nicholas Edward Ellis Allenby, Michael John Hall, Katsuhiko S. Murakami, and Nikolay Zenkin

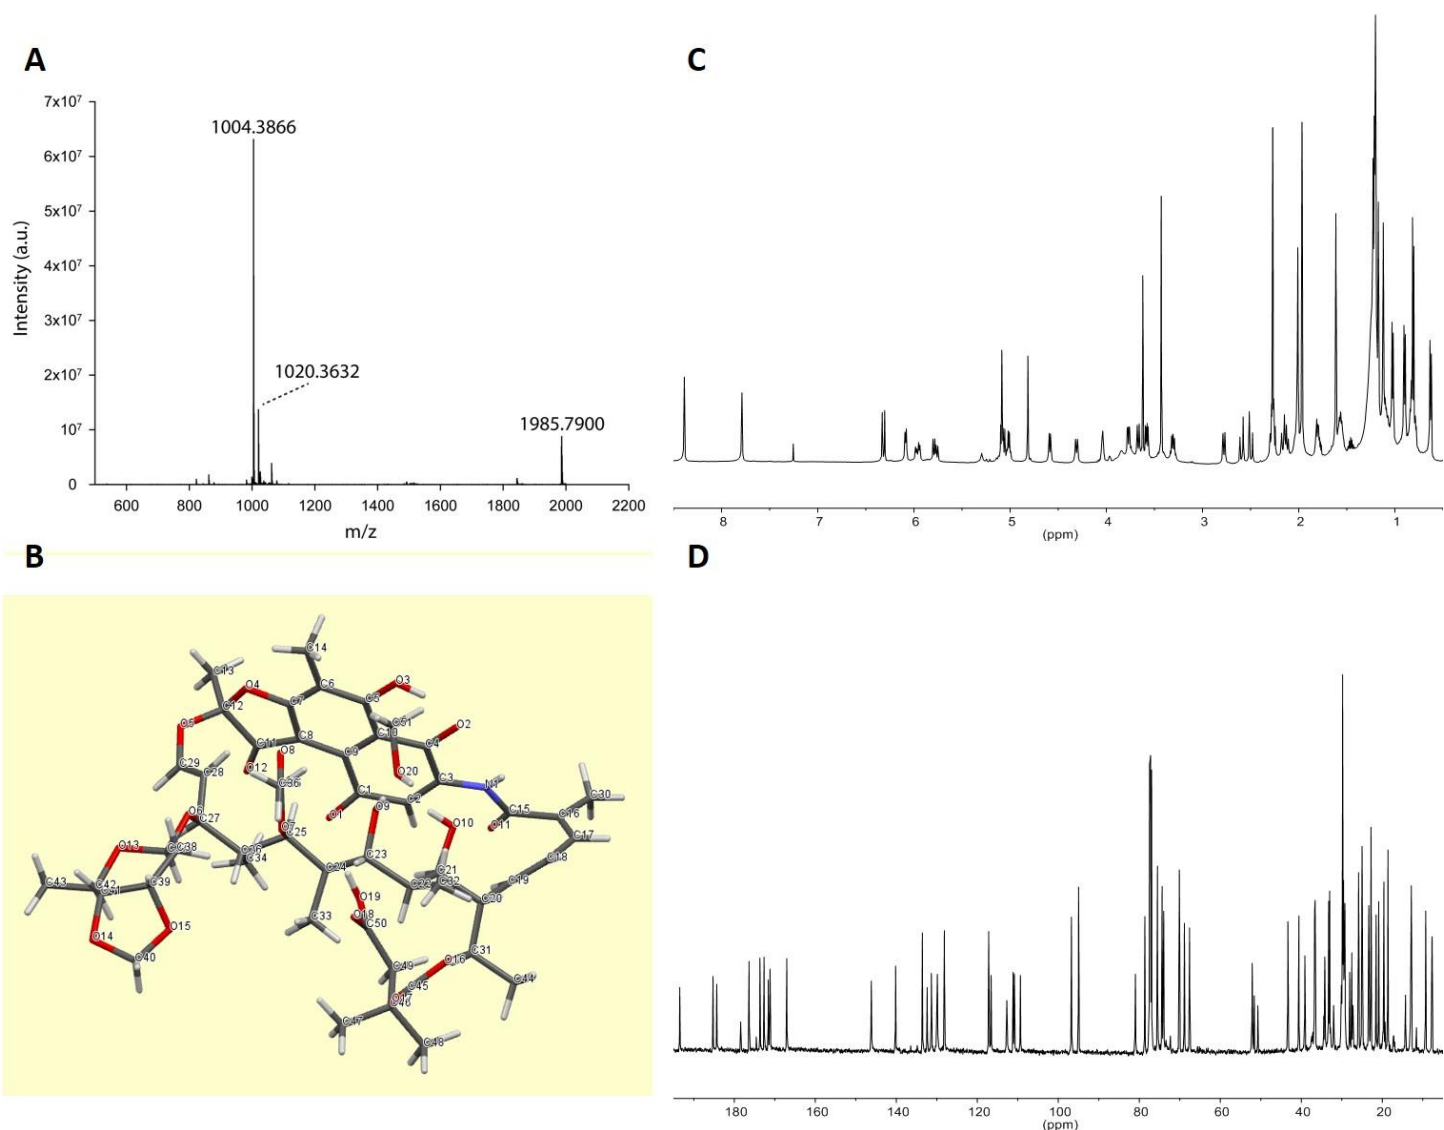

Figure S1. Related to Fig. 1B. **A.** Mass spectrum of KglA showing peaks at 1004.3866, 1020.3632 and 1985.7900 Da, assigned as $[M+Na]^+$, $[M+K]^+$ and $[2M+Na]^+$ respectively. **B.** Crystallographically determined structure of KglA (from synchrotron data). Non-H atoms are labelled. **C.** 500 MHz ^1H NMR spectra of KglA in CDCl_3 . **D.** 125 MHz $^{13}\text{C}\{^1\text{H}\}$ NMR spectra of KglA in CDCl_3 .

Table S1. Related to Fig. 1B. Assignment of the ^1H and ^{13}C NMR data of KglA

Atom no.	δ_{C}	^1H				$^{13}\text{C}-^1\text{H}$ (HMBC)

^[a]The integration of the signals in the 1.87 – 1.81 ppm region corresponded to 3 protons. 2 of these protons are assigned as C⁴⁵-H and C²²-H. It is possible that the remaining signal corresponds to an OH.

Figure S2. Related to Fig. 2. **A.** The chemical structure of Kanglemycin A (KglA). The four oxygen atoms forming hydrogen bonds with the RIF-binding pocket of RNAP are marked by red circles. **B.** Conformations of KglA and RIF in the RIF-binding pocket of *T. thermophilus* RNAP. KglA (red) and RIF (grey) are shown as stick models; the KglA's ansa-bridge C20 and C27 side chains are shown in yellow and labeled; the C3 side chain of RIF is labeled. **C.** Sequence alignment spanning the RIF resistance-determining regions (RRDRs) in the β subunit (RpoB) of RNAPs from *M. tuberculosis* H37RV (MTB), *M. smegmatis* (MSM), *E. coli* and *T. thermophilus* (Tth). Amino acid residues involved in the KglA interaction (Fig. 2) and also having mutations to generate the RIF-resistant RNAPs (Figs. 1 and 3) investigated in this study are indicated by asterisks.

D. Amino acid residues of the β subunit of RNAPs involved in the KglA and initiating NTP (iNTP) interactions. **E.** Involvement of KglA-specific interaction with β R143 in KglA activity. Error bars are \pm SD. The brackets contain calculated $\text{IC}_{50} \pm \text{SE}$. IC_{50} of KglA for double mutant was beyond our measurement limit.
