

1 **Supplementary information:**

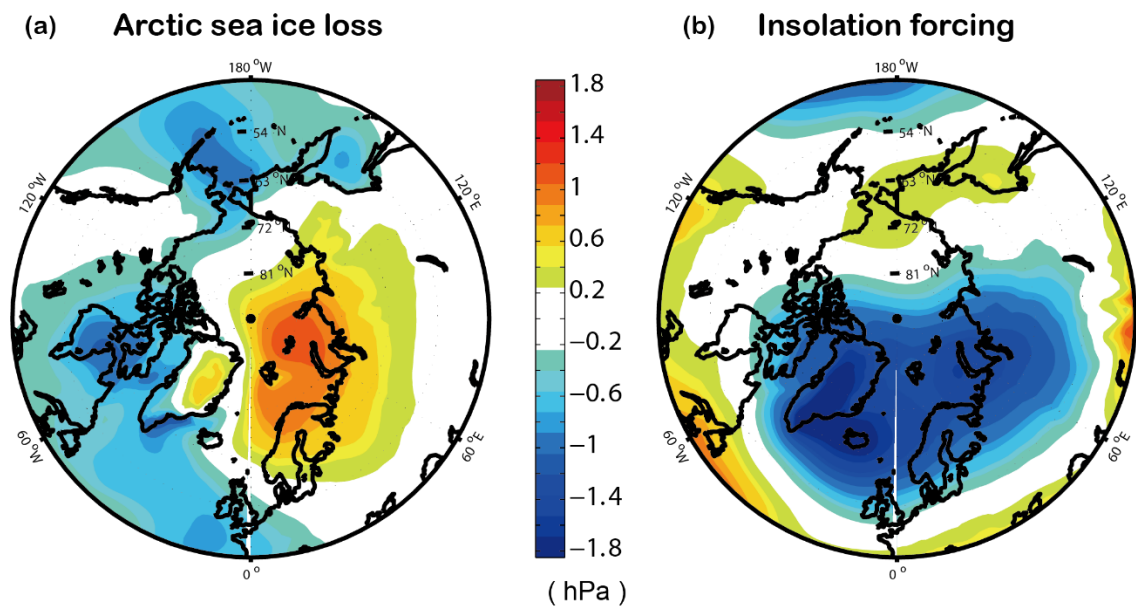

2 **The impact of Arctic sea ice loss on mid-Holocene climate**

3 Park et al.

4

5

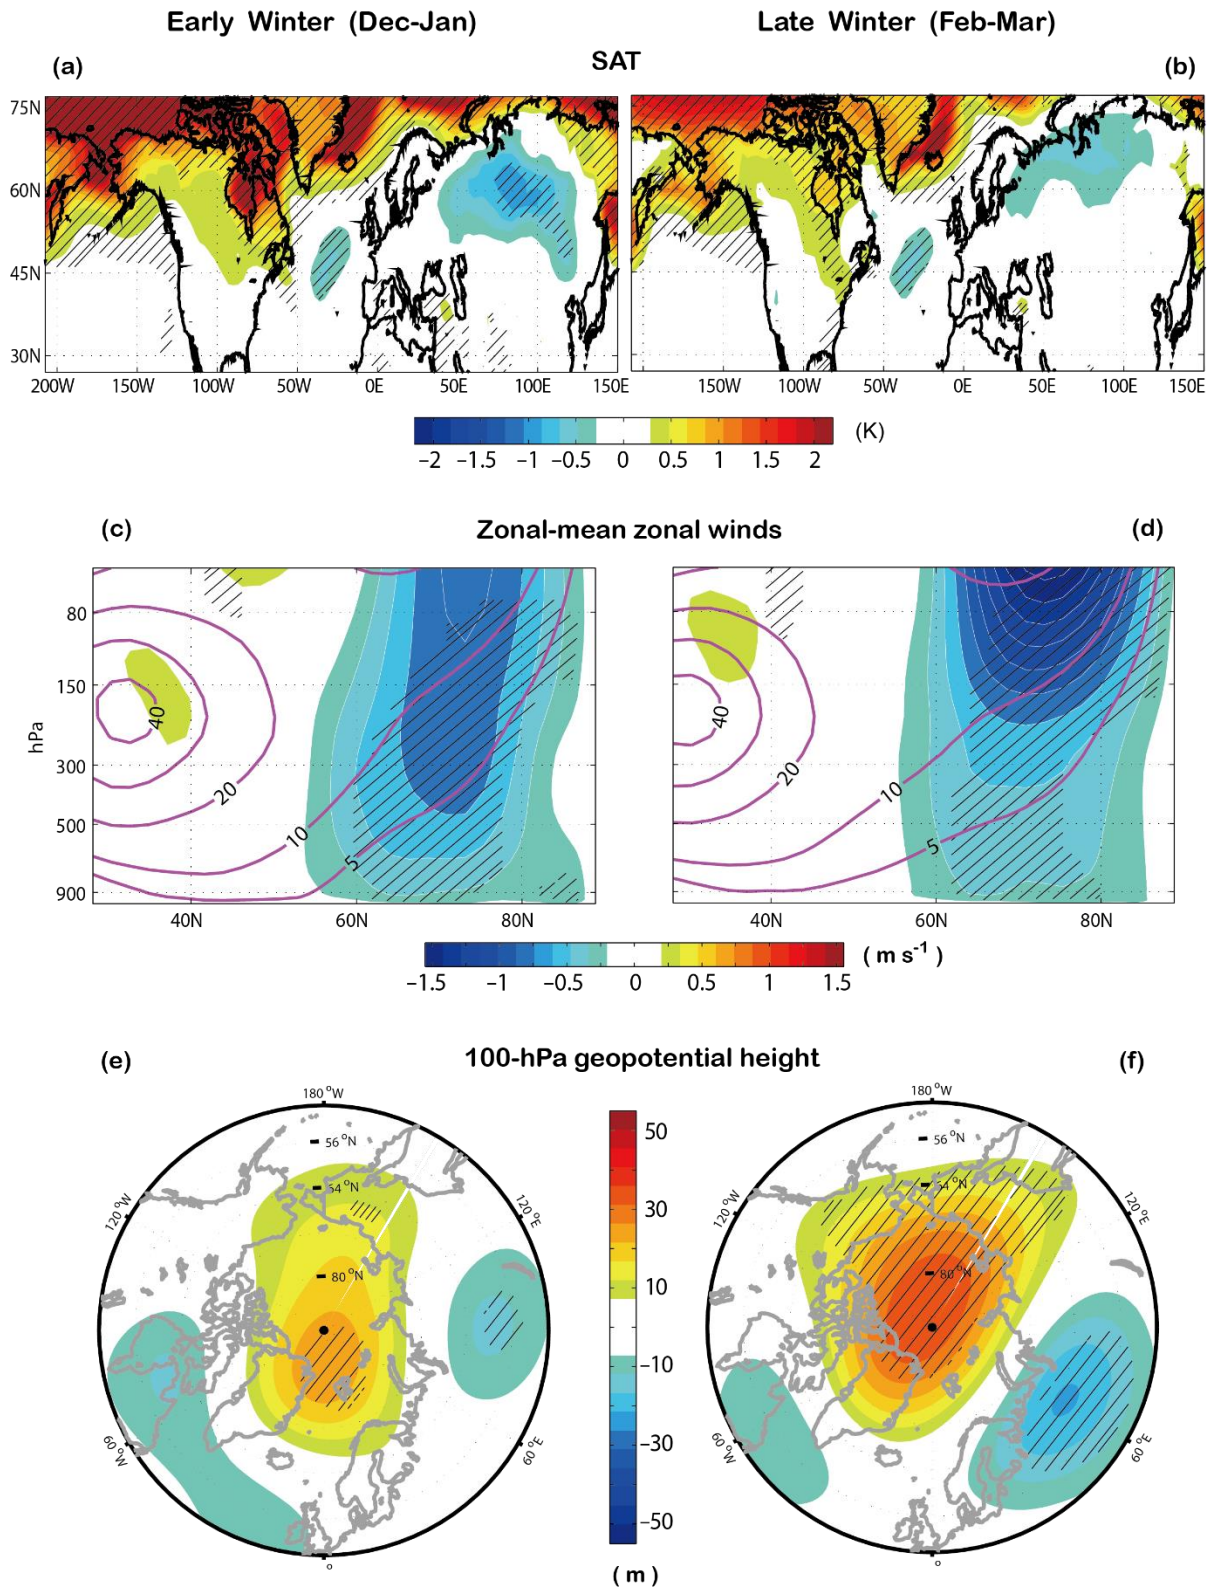

Sea level pressure in winter (DJFM)

8 **Supplementary Figure 1:** Sea level pressure responses to (a) Arctic sea ice loss and (b)
9 insolation forcing in winter (December–March).

10

11

12

13 **Supplementary Figure 2:** (a, b) Surface air temperature (K), (c, d) zonal-mean zonal winds
 14 (m s⁻¹) and (e, f) 100-hPa geopotential height (m) responses to Arctic sea ice loss during (left

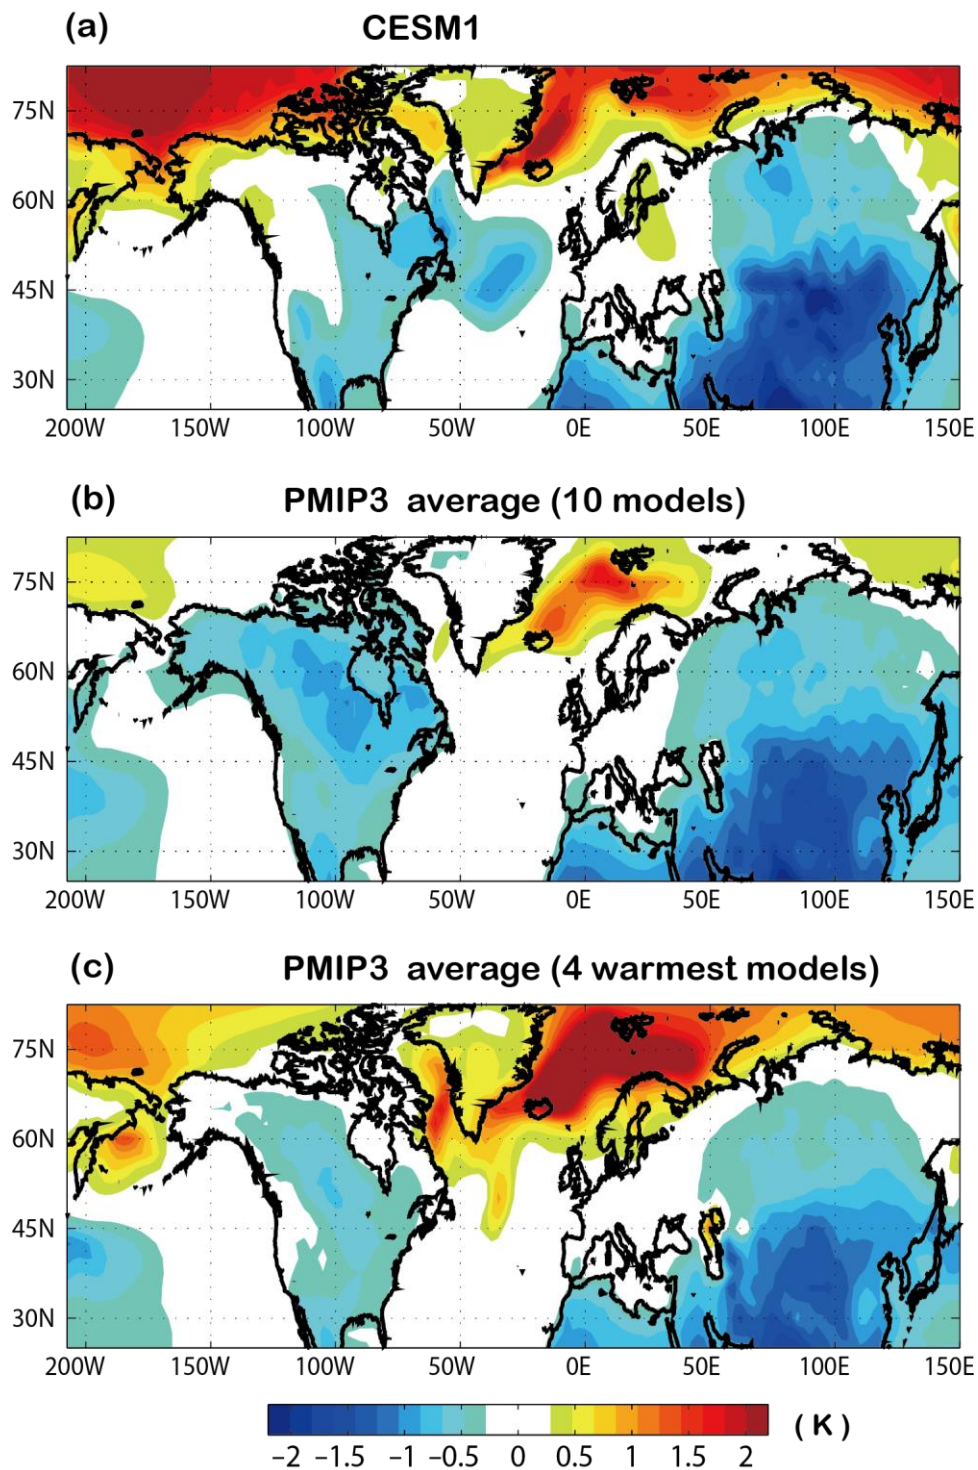

15 column: **a, c, e**) early winter (December – January) and (right column: **b, d, f**) late winter
16 (February – March). In (**c, d**), purple lines are climatological-mean zonal-mean zonal winds
17 from the mid-Holocene with pre-industrial sea ice simulation. For all plots, statistically
18 significant values ($p < 0.05$) are hatched.

19

20

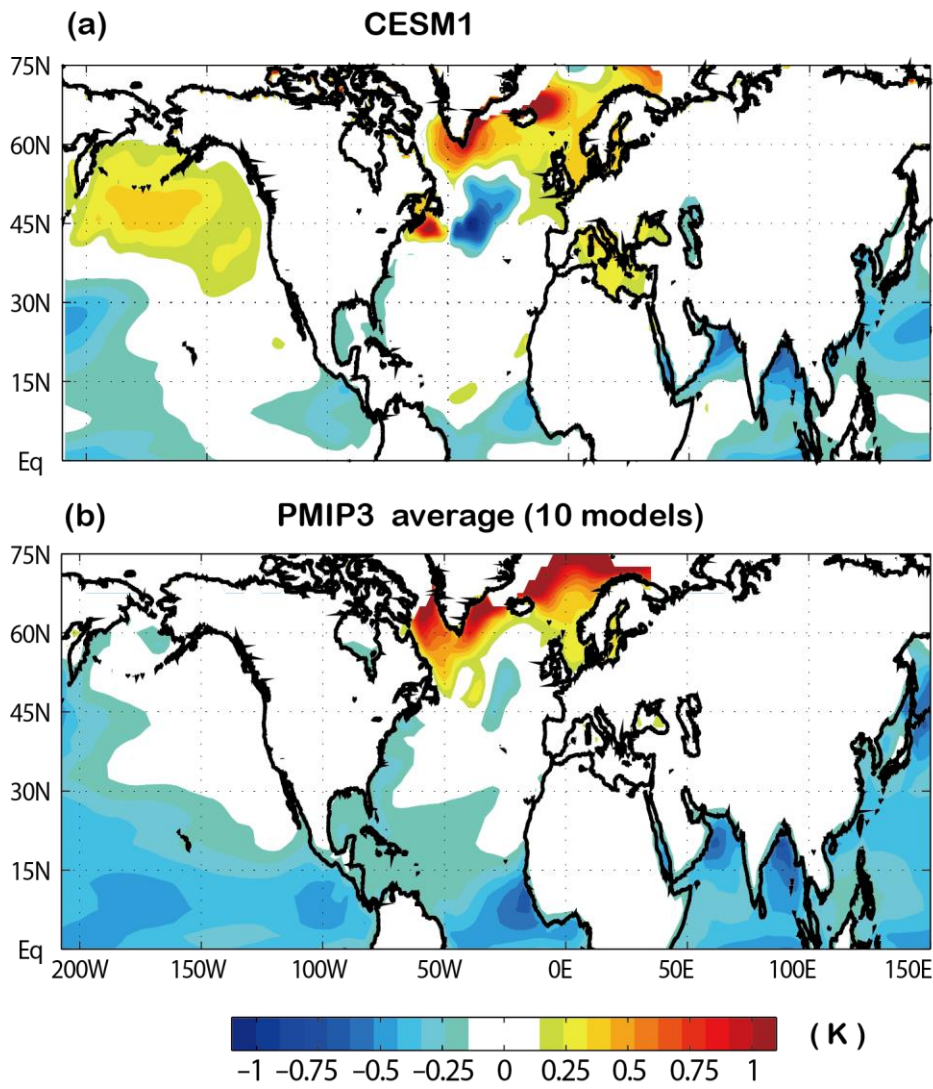

21

22

23

24 **Supplementary Figure 3:** The wintertime (December–March) SAT anomalies in the mid-
 25 Holocene simulation (differences between the mid-Holocene and pre-industrial simulations)
 26 from (a) CESM1, (b) the PMIP3 multi-model average (10 models) and (c) PMIP3 average of
 27 4 warmest models in the Arctic.

29

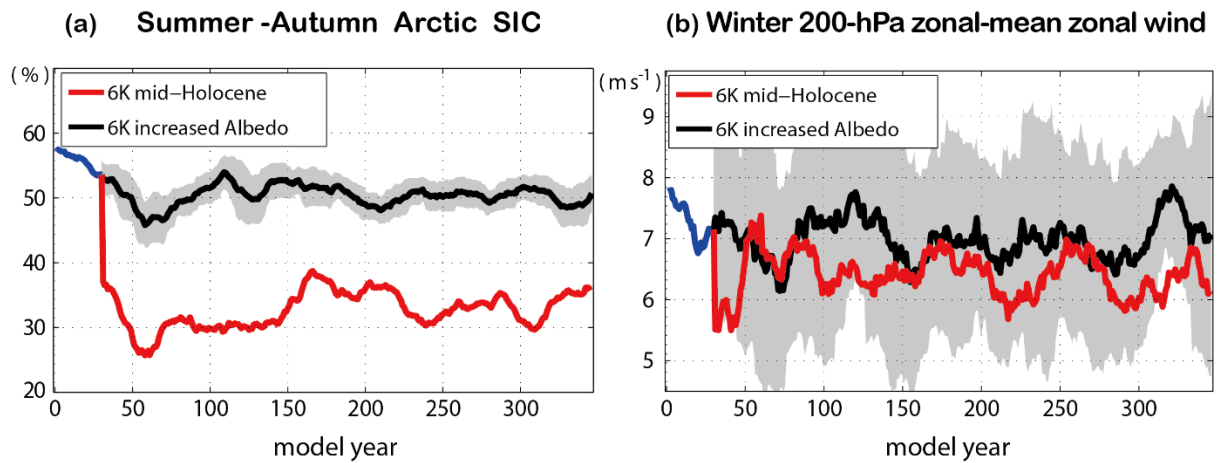

30

31 **Supplementary Figure 4:** The annual-mean SST anomalies in the mid-Holocene simulation
32 (differences between the mid-Holocene and pre-industrial simulations) from (a) CESM1 and
33 (b) the PMIP3 multi-model average (10 models).

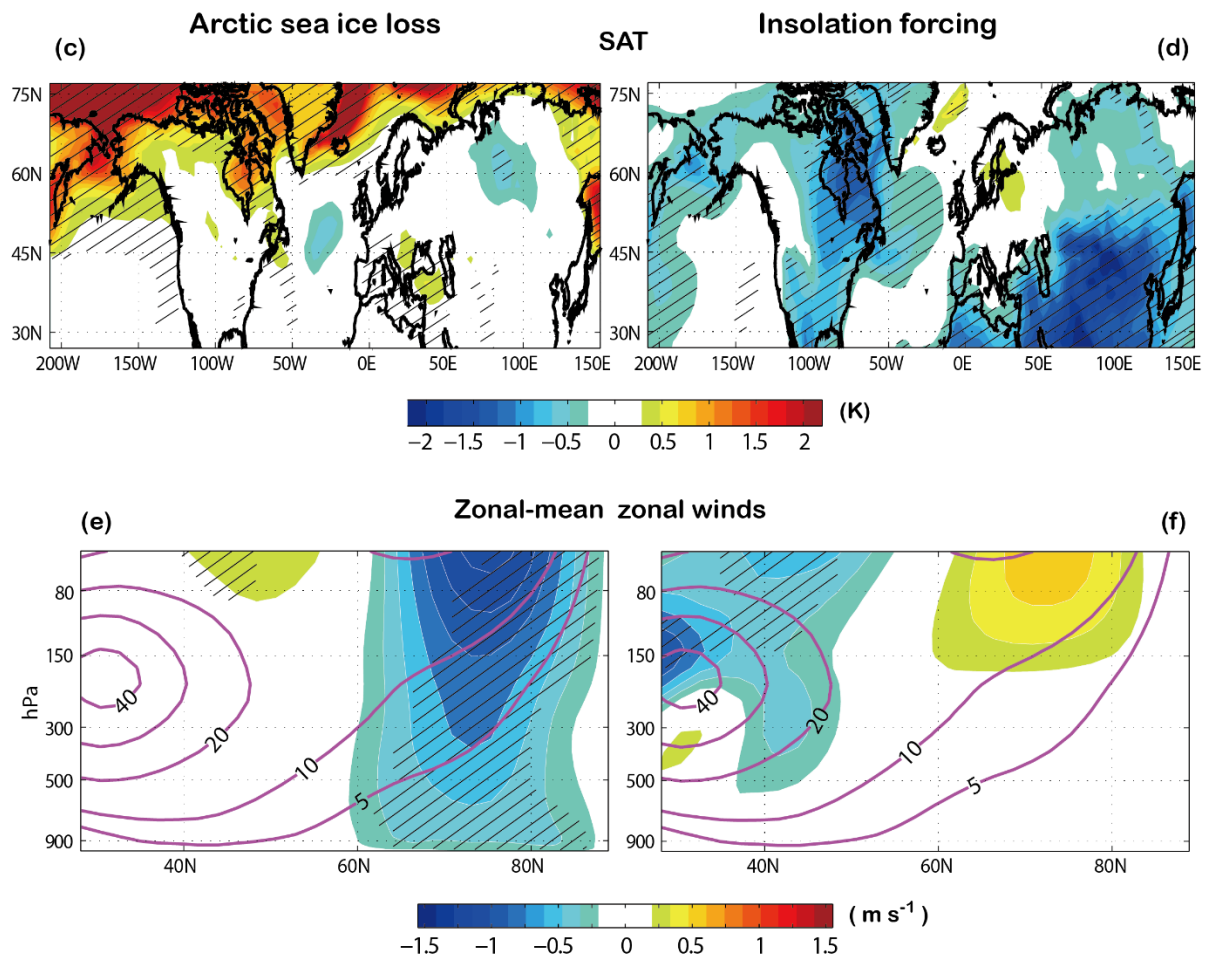

34

35

36

Winter (DJFM): averages of the last 150 years

37

38 **Supplementary Figure 5:** The 20-year running averages of (a) Arctic summer (July–
 39 November) sea ice concentration (%) and (b) the wintertime (December–March) 200-hPa
 40 zonal-mean zonal wind speed (m s⁻¹) averaged from 65°N to 80°N, for the mid-Holocene (red),

41 the mid-Holocene with pre-industrial sea ice (black), and the pre-industrial control (blue)
42 simulations. The gray shadings indicate the range of 1 standard deviation from the mean of the
43 mid-Holocene with pre-industrial sea ice (black) simulations. The wintertime (December–
44 March) responses of **(c, d)** surface air temperature (K) and **(e, f)** zonal-mean zonal winds (m s^{-1})
45 to mid-Holocene Arctic sea ice loss **(c, e)** and insolation forcing **(d, f)**, averaged over the last
46 150 years. Supplementary Fig. **5(c, d, e, f)** are same as Fig. **3(a, b, c, d)**, except that the averaging
47 periods between these two plots are different (last 150 years vs. last 265 years).

49

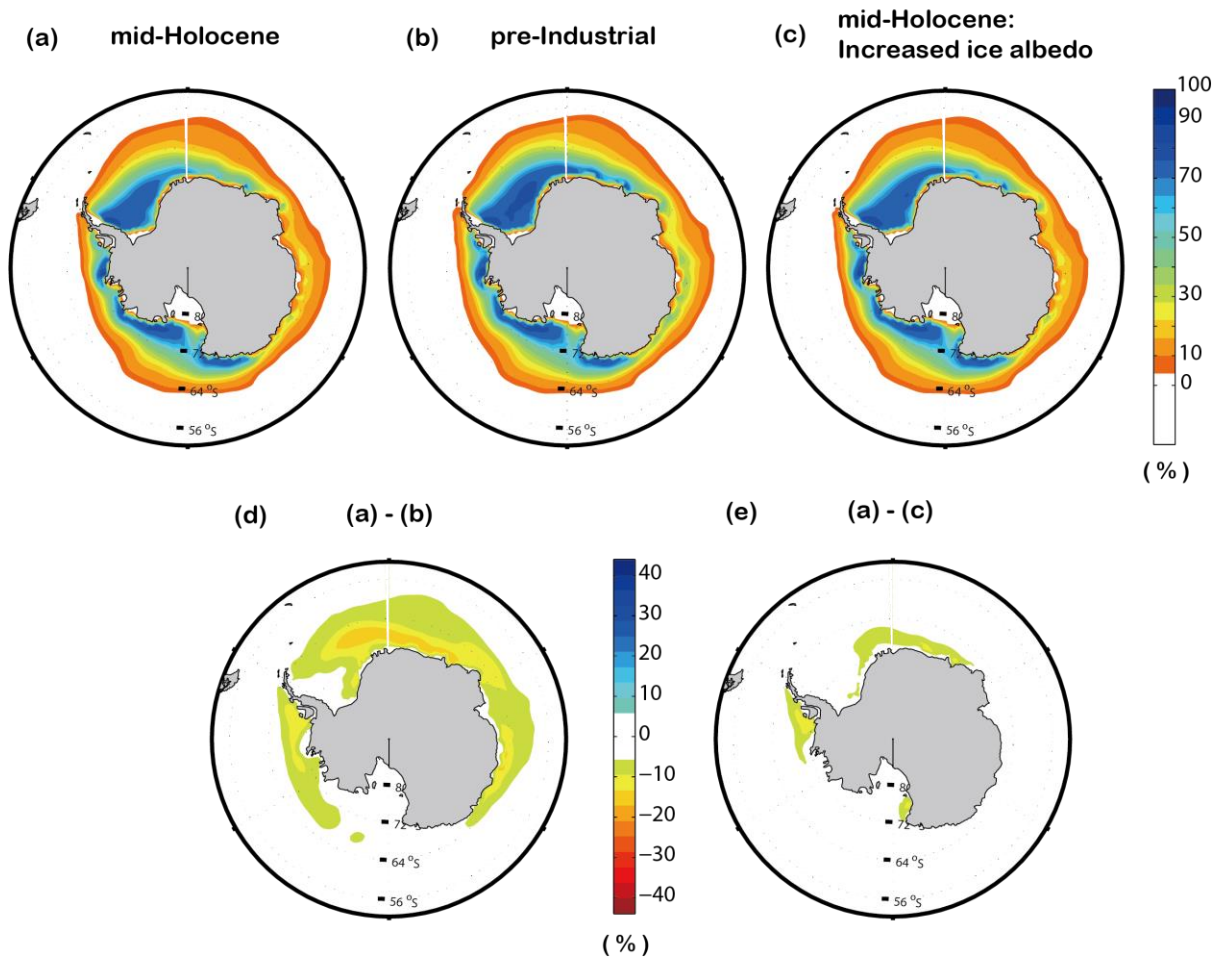

50

51

52

53

Southern Hemisphere summer (DJFM) sea ice concentration

54

55

56 **Supp. Figure 6:** Antarctic sea ice concentration (%) from (a) the mid-Holocene simulation, (b)
 57 the pre-industrial simulation and (c) the mid-Holocene simulation with increased ice albedo,
 58 during southern hemisphere summer (DJFM). Sea ice concentration differences (d) between
 59 mid-Holocene and pre-industrial simulations, i.e. (a)–(b), and (e) between mid-Holocene and
 60 mid-Holocene with increased ice albedo simulations, i.e. (a)–(c).
