

Supplementary Figure S4. Correlation analysis of antigen-specific serum IgG antibody responses at week 22, primary endpoint plotted against Fc γ R (2a/IIa and 3a/IIIa) dimer assay data, as shown in the scatter plots. Correlations were calculated by Spearman's rank correlation coefficient (r_s) and shown in boxes. The box colors reflect degree of correlation. The significance of the correlations is represented by asterisks: * $p < 0.05$; ** $p < 0.01$; and *** $p < 0.001$.
