

THE LANCET

Supplementary appendix

This appendix formed part of the original submission and has been peer reviewed. We post it as supplied by the authors.

Supplement to: Steel N, Ford JA, Newton JN, et al. Changes in health in the countries of the UK and 150 English Local Authority areas 1990–2016: a systematic analysis for the Global Burden of Disease Study 2016. *Lancet* 2018; published online Oct 24. [http://dx.doi.org/10.1016/S0140-6736\(18\)32207-4](http://dx.doi.org/10.1016/S0140-6736(18)32207-4).

Appendix

Title: Changes in health in the countries of the UK and 150 English Local Authority areas 1990–2016: a systematic analysis for the Global Burden of Disease Study 2016

Contents	Page(s)
Appendix Table 1: List of data sources used for diabetes across UK countries	2–6
Appendix Table 2: List of data sources used for chronic obstructive pulmonary disease (COPD) across UK countries	7
Appendix Table 3: List of data sources used for low back and neck pain across UK countries	8–10
Appendix Table 4: List of data sources used for skin conditions across UK countries	11–17
Appendix Table 5: List of data sources used for depressive disorders across UK countries	18–20
Appendix Table 6: Correlation coefficients between Upper Tier Local Authority estimates and Index of Multiple Deprivation (IMD) scores for the 20 causes with the highest national burden for years of life lost (YLLs) in England, 2016	21
Appendix Figure 1. Age-standardised disability-adjusted life years (DALYs) rate per 100,000 population, for the 20 causes with the highest DALY burden in order of decreasing national burden and decreasing Upper Tier Local Authority (UTLA) deprivation (Index of Multiple Deprivation [IMD]), England, both sexes, 2016	22–25
Appendix Figure 2: Age-standardised years of life lost (YLLs) rate per 100,000 population, for the 20 causes with the highest national YLL burden in order of decreasing burden and decreasing Upper Tier Local Authority (UTLA) deprivation (Index of Multiple Deprivation [IMD] score), England both sexes, 2016	26–29
Appendix Figure 3: Age-standardised years lived with disability (YLDs) rate per 100,000 population for the 20 causes with the highest national YLD burden in order of decreasing burden and decreasing Upper Tier Local Authority (UTLA) deprivation (Index of Multiple Deprivation [IMD]), England, both sexes, 2016	30–33
Appendix Figure 4: Attributable risk for age-standardised all-cause years of life lost (YLLs) rate per 100,000 population for nine major risk factors, and Upper Tier Local Authority (UTLA) level Index of Multiple Deprivation (IMD) score, for 150 UTLAs in England, 2016	34
Appendix Figure 5: Age-standardised attributable risk for all-cause years of life lost (YLLs) rate per 100,000 population in order of decreasing Upper Tier Local Authority (UTLA) deprivation (Index of Multiple Deprivation [IMD]), England, both sexes, 2016	35–39
Appendix Figure 6: Population attributable fraction for risk factors for all-cause age-standardised years of life lost (YLLs) rate per 100,000 population per year, in order of decreasing Upper Tier Local Authority (UTLA) deprivation (Index of Multiple Deprivation [IMD]), England, both sexes, 2016	40–44
Appendix Figure 7. Annualised percentage change in all-cause age-standardised years of life lost (YLLs) rate over two time periods (2000-2009 and 2010-2016) by UK country and English Upper Tier Local Authorities (UTLA).	45
Appendix Figure 8: Absolute change in death rate per 100,000 population over time since 1990 by age group, UK	46
Appendix Figure 9: Absolute change in years of life lost (YLL) rate per 100,000 population over time since 1990 by age group, UK	47
Appendix Figure 10: Mean annual change in attributable risk for all-cause age-standardised years of life lost (YLLs) rate per 100,000 population over three time periods, 1990-2000, 2000-2010, and 2010-2016 ranked by the highest rate, England	48
Appendix Figure 11: Mean annualised percentage change in all-cause age-standardised years of life lost (YLLs) over three time periods compared to Index of Multiple Deprivation (IMD) score, English Upper Tier Local Authorities (UTLAs) for both sexes combined	49
Appendix Figure 12: Mean annualised percentage change in all-cause age-standardised years of life lost (YLLs) rate per 100,000 population for the most affluent 10% and the least affluent 10% Upper Tier Local Authorities (UTLAs), England, both sexes, 1990 to 2016	50
Appendix Figure 13: Age standardised years lived with disability (YLDs) rate per 100,000 population for the 10 causes with the highest YLD burden by Global Burden of Disease level, United Kingdom both sexes combined, 2016	51
Data source identification and adjustment	52–53

Appendix Table 1: List of data sources used for diabetes across UK countries

Appendix Table 6: Correlation coefficients between Upper Tier Local Authority estimates and Index of Multiple Deprivation (IMD) scores for the 20 causes with the highest national burden for years of life lost (YLLs) in England, 2016

20 causes with the highest burden for YLLs		
Cause	Correlation coefficient (r)	P value
All causes	0.82	<0.001
Ischaemic heart disease	0.75	<0.001
Trachea, bronchus, and lung cancer	0.81	<0.001
Cerebrovascular disease	0.60	<0.001
Alzheimer's disease and other dementias	NA	
Chronic obstructive pulmonary disease	0.81	<0.001
Lower respiratory infections	0.68	<0.001
Colon and rectum cancer	0.59	<0.001
Cirrhosis and other chronic liver diseases	0.75	<0.001
Breast cancer	NA	
Self-harm	NA	
Other cardiovascular and circulatory diseases	0.68	<0.001
Pancreatic cancer	0.73	<0.001
Prostate cancer	0.33	<0.001
Oesophageal cancer	0.57	<0.001
Other neoplasms	0.52	<0.001
Stomach cancer	0.79	<0.001
Leukaemia	0.66	<0.001
Neonatal preterm birth complications	NA	
Congenital birth defects	NA	
Brain and nervous system cancer	0.06	0.457

NA = Not applicable because assumptions of Pearson's correlation coefficient not met.

Appendix Figure 1. Age-standardised disability-adjusted life years (DALYs) rate per 100,000 population, for the 20 causes with the highest DALY burden and decreasing Upper Tier Local Authority (UTLA) deprivation (Index of Multiple Deprivation [IMD]), England, both sexes, 2016

Upper Tier Local Authority	IMD score	All causes	Low back and neck pain	Ischaemic heart disease	Skin and subcutaneous diseases	Migraine	Sense organ diseases	Depressive disorders	Trachea, bronchus, and lung cancer	Cerebrovascular disease	Chronic obstructive pulmonary disease	Falls	Drug use disorders	Alzheimer's disease and other dementias	Anxiety disorders	Asthma	Oral disorders	Other musculoskeletal disorders	Congenital birth defects	Neonatal preterm birth	Lower respiratory infections	Self-harm
England (95% uncertainty interval)	NA	19995 (17149 - 23222)	1820 (1277 - 2387)	1139 (1099 - 1184)	1068 (730 - 1505)	719 (463 - 1007)	667 (462 - 922)	664 (454 - 910)	633 (618 - 652)	570 (524 - 611)	507 (479 - 548)	450 (330 - 597)	443 (363 - 523)	440 (371 - 526)	435 (304 - 591)	375 (255 - 526)	355 (217 - 551)	352 (245 - 490)	350 (313 - 398)	349 (311 - 390)	339 (317 - 358)	335 (287 - 367)

 Statistically significantly lower than the England mean
 Statistically significantly higher than the England mean

Appendix Figure 2: Age-standardised years of life lost (YLLs) rate per 100,000 population, for the 20 causes with the highest national YLL burden and decreasing Upper Tier Local Authority (UTLA) deprivation (Index of Multiple Deprivation [IMD] score), England both sexes, 2016

Upper Tier Local Authority	IMD score	All causes	Ischaemic heart disease	Trachea, bronchus, and lung cancer	Cerebrovascular disease	Chronic obstructive pulmonary disease	Alzheimer's disease and other dementias	Lower respiratory infections	Self-harm	Cirrhosis and other chronic liver diseases	Colon and rectum cancer	Breast cancer	Neonatal preterm birth	Congenital birth defects	Other cardiovascular and circulatory diseases	Road injuries	Pancreatic cancer	Drug use disorders	Other neoplasms	Oesophageal cancer	Brain and nervous system cancer	Prostate cancer

Note: no estimates are statistically significantly different from England mean

Appendix Figure 4: Attributable risk for age-standardised all-cause years of life lost (YLLs) rate per 100,000 population for nine major risk factors, and Upper Tier Local Authority (UTLA) level Index of Multiple Deprivation (IMD) score, for 150 UTAs in England, 2016

Appendix Figure 5: Age-standardised attributable risk for all-cause years of life lost (YLLs) rate per 100,000 population in order of decreasing Upper Tier Local Authority (UTLA) deprivation (Index of Multiple Deprivation [IMD]), England, both sexes, 2016

Upper Tier Local Authority	IMD score	All risk factors	Tobacco	Dietary risks	High systolic blood pressure	Alcohol and drug use	High body-mass index	High total cholesterol	Occupational risks	High fasting plasma glucose	Air pollution	Child and maternal malnutrition	Low physical activity	Impaired kidney function	Unsafe sex	Low bone mineral density	Other environmental risks	Sexual abuse and violence	Unsafe water, sanitation, and handwashing

 Statistically significantly lower than the England mean
 Statistically significantly higher than the England mean

Appendix Figure 6: Population attributable fraction for risk factors for all-cause age-standardised years of life lost (YLLs) rate per 100,000 population per year, in order of decreasing Upper Tier Local Authority (UTLA) deprivation (Index of Multiple Deprivation [IMD]), England, both sexes, 2016

Upper Tier Local Authority	IMD score	All risk factors	Tobacco	Dietary risks	High systolic blood pressure	Alcohol and drug use	High body-mass index	High total cholesterol	Occupational risks	High fasting plasma glucose	Air pollution	Child and maternal malnutrition	Low physical activity	Impaired kidney function	Unsafe sex	Low bone mineral density	Other environmental risks	Sexual abuse and violence	Unsafe water, sanitation, and handwashing

Appendix Figure 9: Absolute change in years of life lost (YLL) rate per 100,000 population over time since 1990 by age group, UK

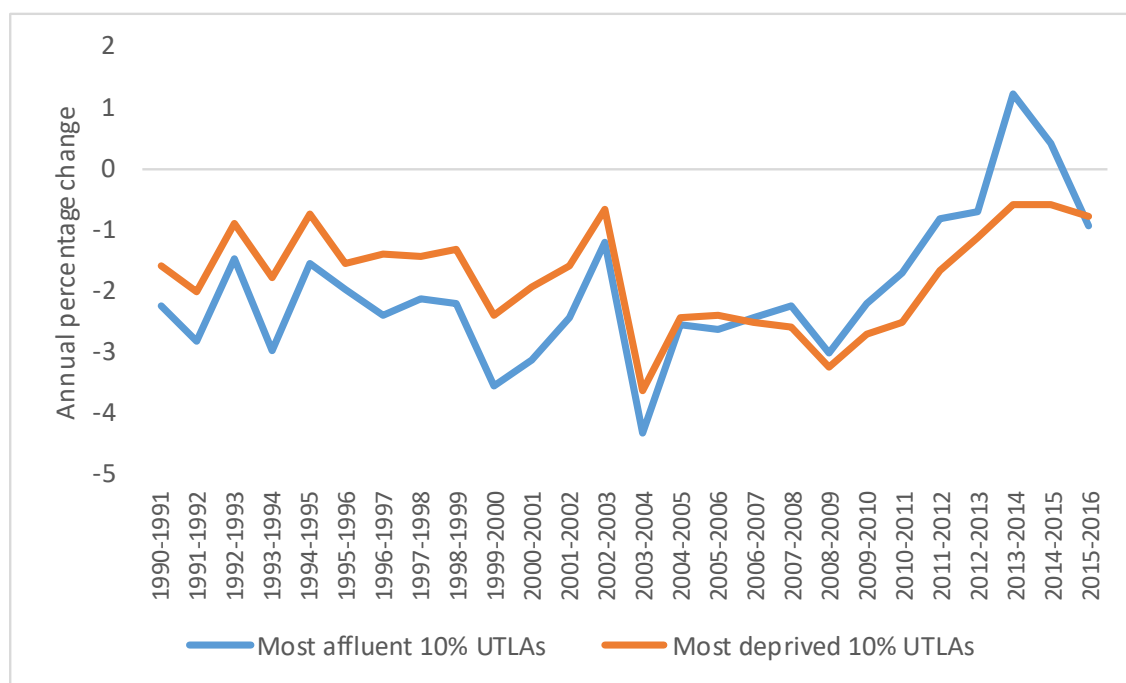

Appendix Figure 10: Mean annual change in attributable risk for all-cause age-standardised years of life lost (YLLs) rate per 100,000 population over three time periods, 1990-2000, 2000-2010, and 2010-2016 ranked by the highest rate, England

Appendix Figure 11: Mean annualised percentage change in all-cause age-standardised years of life lost (YLLs) over three time periods compared to Index of Multiple Deprivation (IMD) score, English Upper Tier Local Authorities (UTLAs) for both sexes combined

Appendix Figure 12: Mean annualised percentage change in all-cause age-standardised years of life lost (YLLs) rate per 100,000 population for the most affluent 10% and the least affluent 10% Upper Tier Local Authorities (UTLAs), England, both sexes, 1990 to 2016

Appendix Figure 13: Age standardised years lived with disability (YLDs) rate per 100,000 population for the 10 causes with the highest YLD burden by Global Burden of Disease level, United Kingdom both sexes combined, 2016

Data source identification and adjustment

Estimation of YLDs has eight major components. These are described more completely in the appendix of the GBD 2016 paper on non-fatal estimatesⁱ, but the first two components include identifying and adjusting data in order to estimate prevalence and incidence for specific causes and sequelae for each geographic area.

Each cause has its own case definition and diagnostic criteria for identifying and accepting data that can be used in the modelling process. Although specific to each cause the general process includes:

- a. Systematic selection of studies. These are undertaken for each cause and search terms are available in the appendix of the GBD paper on non-fatal estimatesⁱⁱ. Inclusion and exclusion criteria were applied to the studies returned.
- b. In addition to study searches, additional data inputs for each cause were included depending on relevance and acceptability. Surveys, registry data, hospital data and surveillance system outputs are examples of this data. Generally, where case definition relevant individual-level data was available, this superseded data from study sources. Data sources included in models include country specific data, as well as data from non-country specific sources.

Prior to estimation of prevalence and incidence, many of the data sources undergo some form of adjustment and these are specific to the cause in question. For example, where different physiological measures are reported that differ from the case definition, then some adjustment to the reference definition will be undertaken. Age and sex splitting of the data is also carried on data sources where the required sex or age-groups are either not reported or too broad.

For example, Diabetes mellitus in the GBD 2016 was defined using a case definition of fasting plasma glucose (FPG) >126 mg/dL (7 mmol/L), or being on treatment for diabetes. However, the criteria accepted other measures of blood sugar (haemoglobin A1c [HbA1c], oral glucose tolerance test, or post prandial glucose test) to define diabetes. Data source input searching included a) systematic study searches; b) systematic search of the Global Health Data Exchange (GHDx) for survey programs and national surveys, as well as longitudinal studies tagged with either FPG or Diabetes mellitus; and c) datasets from other leaders in the field. The four data inputs include estimates of diabetes within a population, estimates of mean FPG, individual level data measured from surveys and Insurance claims data from the US. England specific data inputs accepted for the diabetes model include country-representative survey data (from the Health Survey for England) of blood measures and a number of published papers.

The data adjustment processes for diabetes included time, age and sex splitting of data sources, as well as adjustments to data points with alternative case-definitions in order to standardise data to the reference definition. For England survey data, blood glucose measures are reported as HbA1c. A reference of HbA1c of >6.5 was assumed to be the threshold equivalent to the GBD FPG case definition of diabetes.

The case definition for COPD is defined in GBD 2016 as in the Global Initiative for Chronic Obstructive Lung Disease (GOLD) classification: a measurement of <0.7 FEV₁/FVC (one second of forceful exhalation/total forced expiration) on spirometry after bronchodilationⁱⁱⁱ. This matches to a partial definition in the National Institute for Health and Care Excellence (NICE) guidelines used in England and Wales 101^{iv}, but NICE guidelines state where FEV₁ is $\geq 80\%$ predicted normal a diagnosis of COPD should only be made in the presence of respiratory symptoms.

A systematic selection of studies were included using reported measures of COPD, excluding studies with smokers. An additional criteria for acceptance also included surveys, but only where COPD was reported using spirometry data and outcomes were within a plausible range. Where an alternative case definition was reported in accepted data sources, these were adjusted to GOLD classifications based on reference material linking definitions. The only England-specific data accepted with the search selection included one study based on measures taken from the Health Survey for England.
