Supplementary Data 1 - The inclusion criteria of individual molecules in an organ were (1) observation of corresponding MS signal in three independent experiments and (2) confirmation of individual compounds by MS/MS analysis of permethylated glycans. The structural analysis of N-glycans was mostly based on the CID MS/MS fragmentation patterns of permethylated N-glycans in positive mode, in accordance with knowledge of embryonic N-glycans^{1–5}. Graphical representation is based on accepted conventions for N-glycans and monosaccharide nomenclature as follows: yellow circle, Gal; yellow square, GalNAc; blue circle, Glc; blue square, GlcNAc; green circle, Man; red triangle, Fuc; purple diamond, Neu5Ac; light blue diamond, Neu5Gc; green diamond, Kdn.^{6,7} Core Fucose is *de facto* positioned on reducing GlcNAc residue

on C6 carbon as for all vertebrate N-glycans. The interglycosidic bonds between monosaccharides of antennae are represented using the conventional positions as in I, C2 position; /, C3 position; —, C4 position; \, C6 position. The respective positions of C3 and C6 branches on internal Man residue of N-glycan core are just indicative.
