

Supplement Figure 4 Dexamethasone suppresses cytokines when co-treated with STIA induction but does not completely abrogate STIA development

(A) Ankle thickness and clinical score of wt mice, co-treated at time of STIA induction (daily from day 0 to day 7) with PBS or Dexamethasone (DEX). (B) Serum cytokine levels are determined by multiplex analysis. Asterisks indicate significances * $p \leq 0,05$. $n=5$ mice per group.
