

Supplementary Figure 1. An Illustrative example of Gradient Boosting Machines (GBM)

GBM builds the model in a step-wise fashion combining information from multiple decision trees.

Step 1. Fit the first decision tree using all the variables to predict the study endpoint. The tree is built using the following process: utilizing all the subjects (e.g., full cohort, as shown below), identify a single variable and split point. For example, for the first tree, total bilirubin did the best job at separating the group into those with a lower and higher risk of the study endpoint event (see below). Then among those with total bilirubin $< X_1$, the best variable that split that subset of subjects was sodium, whereas among those with higher bilirubin ($\geq X_1$), PSC duration did the best job at separating subjects into lower and higher risk (see below).

Step 2. Fit a second decision tree using the residuals from Step 1 – essentially identify where this initial fit did not do a good job fitting the study outcome. Note that the split points are determined separately at each step, so the split point for Sodium in the first tree (X_2) – see above- is different from the split point for Sodium in the second tree (X_4) – see below.

Step 3. Fit the third Decision Tree using the residuals from the Step 2. Repeat this process hundreds or thousands of times. For example, in developing PREsTo 2,500 decision trees were employed.

Step 4. Combine results from all of these decision trees to get the final model. Supplemental Table 1 includes information on all 2,500 decision trees created for this study.

^a All lab values were divided by respective standard deviation

Abbreviations: HR (hazard ratio); CI (confidence interval); SAP x ULN (serum alkaline phosphatase x upper limit of normal); PSC (primary sclerosing cholangitis); IBD (inflammatory bowel disease); BMI (body mass index).

Supplementary Table 3. Exploratory analyses examining PREsTo and Markers of Fibrosis in the Development of Hepatic Decompensation

Prognostic Variable	Patients Included	C-statistic (95% CI)
	213 ^a	
MRE Alone		0.93 (0.90-0.96)
MRE + PREsTo		0.94 (0.91-0.97)
	51 ^b	
Stage of Fibrosis		0.88 (0.80-0.94)
Stage of Fibrosis + PREsTo		0.91 (0.84-0.98)

^a 86 subjects from derivation & 11 from validation cohort. Remaining 116 patients from independent elastography cohort at Mayo Rochester.

^b 38 subjects from derivation & 13 from validation cohort. Fibrosis stage(s) 0 n=1; I n=12; II n=17; III n=12; IV n=9

Abbreviations: MRE (magnetic resonance elastography); PREsTo (PSC risk estimate tool) CI (confidence interval).

Supplementary Table 4. Sensitivity Analyses Examining PREsTo and the Development of Hepatic Decompensation

Sensitivity Analyses	Patients Included	C-statistic (95% CI)
