---

Table S3 Comparison of the COG assignments between high and low SNP regions. The SNP distribution was calculated throughout the reference *B. cereus* AR156 genome by using a sliding-window size of 5 kb. The top 3% regions were considered high SNP regions, whereas the last 3% regions were considered low SNP regions.

	High SNP region	Low SNP region	<i>p</i> -value*
<b>Information storage and processing</b>	<b>14</b>	<b>20</b>	0.02165
Translation, ribosomal structure and biogenesis	2	14	
RNA processing and modification	0	0	
Transcription	9	3	
Replication, recombination and repair	3	3	
Chromatin structure and dynamics	0	0	
<b>Cellular processes and signaling</b>	<b>30</b>	<b>26</b>	0.2134
Cell cycle control, cell division, chromosome partitioning	0	1	

Nuclear structure	0	0	
Defense mechanisms	7	6	
Signal transduction mechanisms	7	2	
Cell wall/membrane/envelope biogenesis	6	12	
Cell motility	0	2	
Cytoskeleton	0	0	
Extracellular structures	0	0	
Intracellular trafficking, secretion, and vesicular transport	1	1	
Posttranslational modification, protein turnover, chaperones	9	2	
<b>Metabolism</b>	<b>46</b>	<b>13</b>	0.04172
Energy production and conversion	6	2	
Carbohydrate transport and metabolism	4	3	

Amino acid transport and metabolism	11	5	
Nucleotide transport and metabolism	4	0	
Coenzyme transport and metabolism	13	0	
Lipid transport and metabolism	2	1	
Inorganic ion transport and metabolism	6	2	
Secondary metabolites biosynthesis, transport and catabolism	0	0	
<b>Poorly characterized</b>	<b>36</b>	<b>13</b>	0.2404

Figure S1 Genome map of *Bacillus cereus* 905. Each ring of the circle has a different genome information: rings from the outside in: (1) scale marks (unit: Mb), (2, 3) protein-coding genes on the forward and reverse strands, respectively (color-coded by the functional categories), (4, 5) rRNA (blue) and tRNA (red) on the forward and reverse strands, respectively, (6) GC content (positive: red; negative: blue), and (7) GC skew (above average: aquamarine; below average: orange).

Figure S2 Phylogenetic tree of 18 *Bacillus* genomes based on the Bayesian inference method. The phylogenetic tree was constructed using 607 single-copy core genes shared by 18 genomes and an out-group (*Paenibacillus polymyxa* M1). The phylogenetic tree was rooted by the out-group. Support values are shown for nodes as bayesian inference posterior probability model bootstrap. Branch lengths were estimated through Bayesian analysis, and the scale bar denotes substitutions per sites.

Figure S3 Phylogenetics tree of 18 *Bacillus* genomes based on the Neighbor-Joining method. The phylogenetic tree was constructed using 607 single-copy core genes shared by 18 genomes and an out-group (*P. polymyxa* M1). The phylogenetic tree was rooted by the out-group. Bootstrap values are shown for each node, and the scale bar represents the number of substitutions per site. Branch lengths are proportional to the amount of evolutionary change.

Tree scale: 100

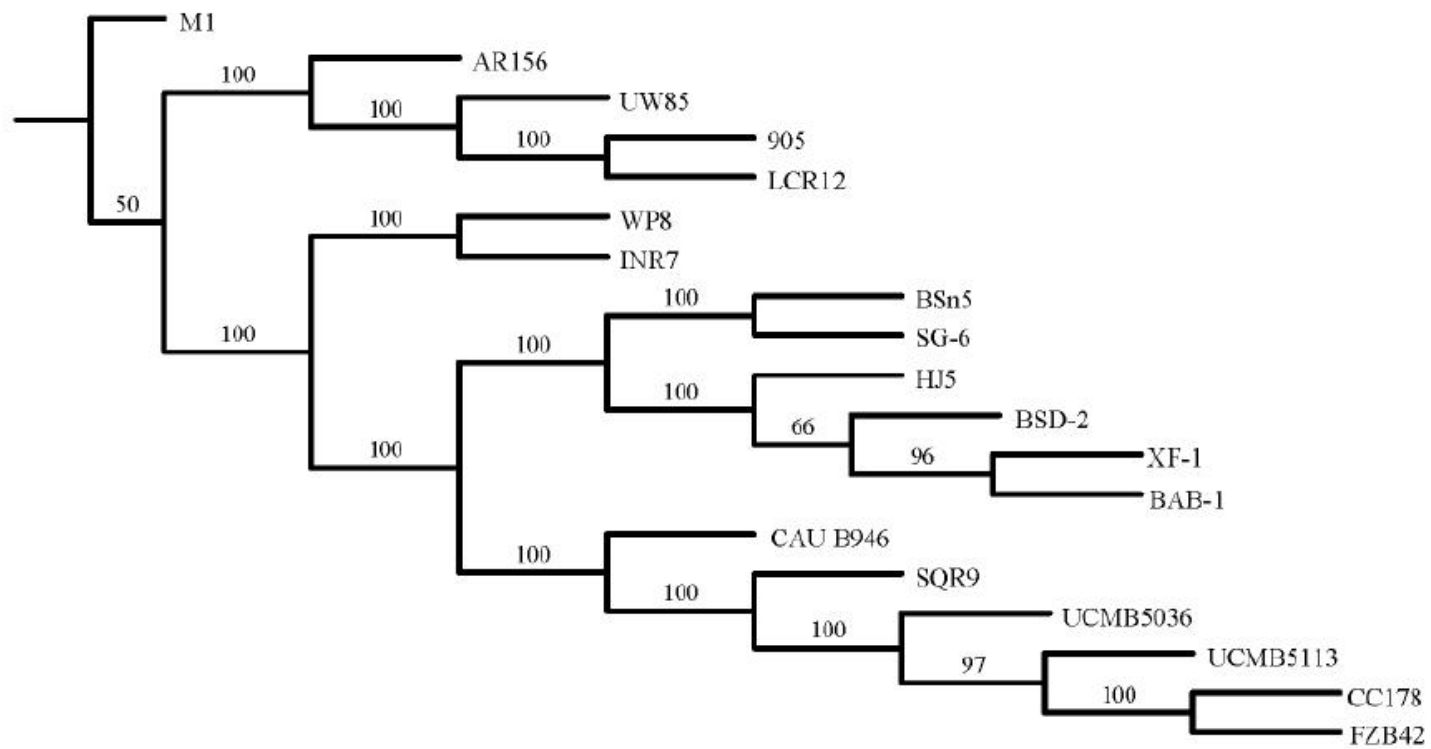

Figure S4 Hierarchical clustering among genomes using the presence/absence of orthologous groups. Approximately unbiased probability and bootstrap probability (au/bp) values were indicated at each node.

Figure S5 The SNPs and insertion nucleotides in the *B. cereus* 905 genome sequence. The red gene represents the strain-specific gene of *B. cereus* 905. In the genome sequence, the green nucleotide represents the conserved region, and the red nucleotide represents SNP regions. The red box indicates the insertion regions in the genome sequence.
