

Supplementary Data

SUPPLEMENTARY FIG. S1. Schematic illustration of cleaved caspase-3 distribution (red) in cFPI CsA animals. Cleaved caspase-3 staining was made from coronal sections of three different levels from bregma (-1.5, -2.0, and -2.5). At two dpi, cleaved caspase-3 expression was similar among all treatment groups at all levels (A-C). At seven dpi, the caspase-3 expression was increased in brain-injured groups (D-F), although then declined and was similar among the treatment groups at 14 dpi (G-I). cFPI, central fluid percussion injury; dpi, days post-injury; CsA, inactive control antibody against cyclosporin A.
