Experiment Section

Extraction and Identification of Natural Compounds—All alkaloids used in this study were isolated from *E. chinensis* by the investigators involved in this research and compound structures were determined by means of 1D and 2D NMR as well as MS.

The extraction and isolation procedures are as follows: the powder of *E. chinensis* (7.5 kg) were extracted three times with EtOH–H₂O (95:5, v/v). The combined extracts were concentrated under reduced pressure, followed by partitioning between EtOAc and 3% tartaric acid. The aqueous phase was adjusted to pH 9–10 with saturated Na₂CO₃ and then extracted with CHCl₃ to give crude alkaloids (40.0 g). The crude alkaloid extract was then subjected to a silica gel CC (300–400 mesh) using a petroleum ether–Me₂CO gradient (1:0–0:1) to obtain four major fractions A–D. Fraction B (3.8 g) was further purified by silica gel CC (300–400 mesh) with petroleum ether–Me₂CO–Et₂NH (10:1:0.2–4:1:0.2, v/v), then followed by Sephadex LH-20 (MeOH) to afford ervachinine A (20.0 mg), ervachinine C (25.0 mg), and decarbomethoxyvoacamine (60.0 mg). Fraction D (4.4 g) was further purified by reversed phase chromatography on a C18 column (MeOH–H₂O, 20:80–100:0) to give three subfractions (D1–D3). Subfraction D2 (1.2 g) was subjected to silica gel CC eluted with petroleum ether–EtOAc (10:1–3:1, v/v), then followed by Sephadex LH-20 CC (MeOH) to afford ervachinine B (17.0 mg), and ervachinine D (17.5 mg). Subfraction D3 (1.0 g) was further purified by silica gel eluting with petroleum ether–Me₂CO (8:1–4:1, v/v), and then Sephadex LH-20 (CHCl₃–MeOH, 1:1) to yield tabernaecorymbosine A (30.0 mg).
