

Supplementary Figure 2.

Supplementary Figure 2. Stat5 induces migration of LNCaP human prostate cancer cells.

LNCaP were infected with adenovirus expressing active Stat5 (Stat5aS710F) or beta-galactosidase at MOI 10, as indicated. Identical scratches were made in parallel wells (n=8) using a 1000 μ l pipette tip 24 h after the adenoviral infection. The cells were fixed, photographed, and wound sizes were measured (i-ii).
