

Supplementary Figure 1. SmGm2 media can maintain the smooth muscle cell populations during long-term culture. Immunofluorescence staining for desmin (green) demonstrated the minimal loss of smooth muscle cells in primary culture of myometrial (myo) and leiomyoma (leio) cells after two passages (P2) in SmGm2 medium (upper panel). In contrast, cells maintained in DMEM/F12 medium resulted in significant loss of smooth muscle cells (lower panel). A counterstain of DAPI (blue) highlighted all nuclei in culture. Cells outlined with white dotted lines were enlarged and shown at the bottom left corners of the corresponding images.

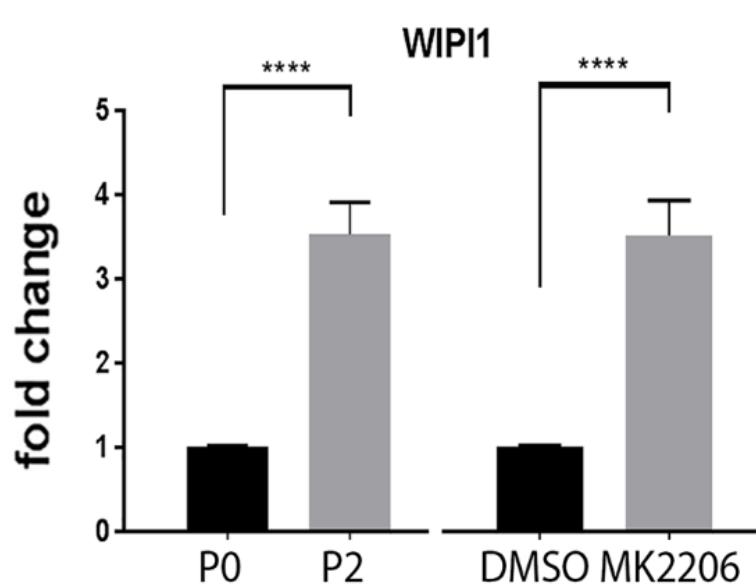

Supplementary Figure 2. Western blot analysis of p21 in myometrium (Myo) and leiomyoma (Leio) cells from P0 and P2. β-actin was used as a loading control.

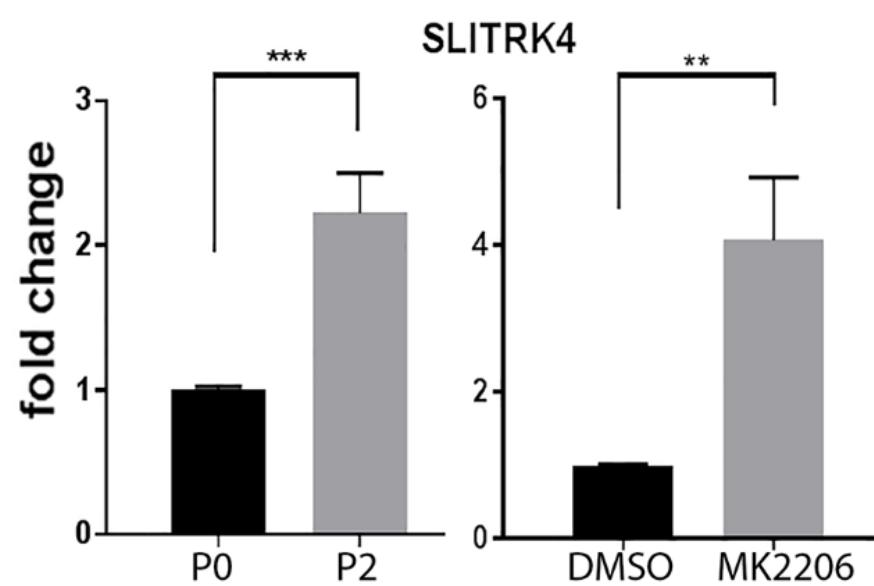

Supplementary Figure 3. Western blots analysis of the selected protein products in leiomyoma (Leio) and myometrial (Myo) cells in control (DMSO) and AKT inhibitor (MK2206) treatment.

A

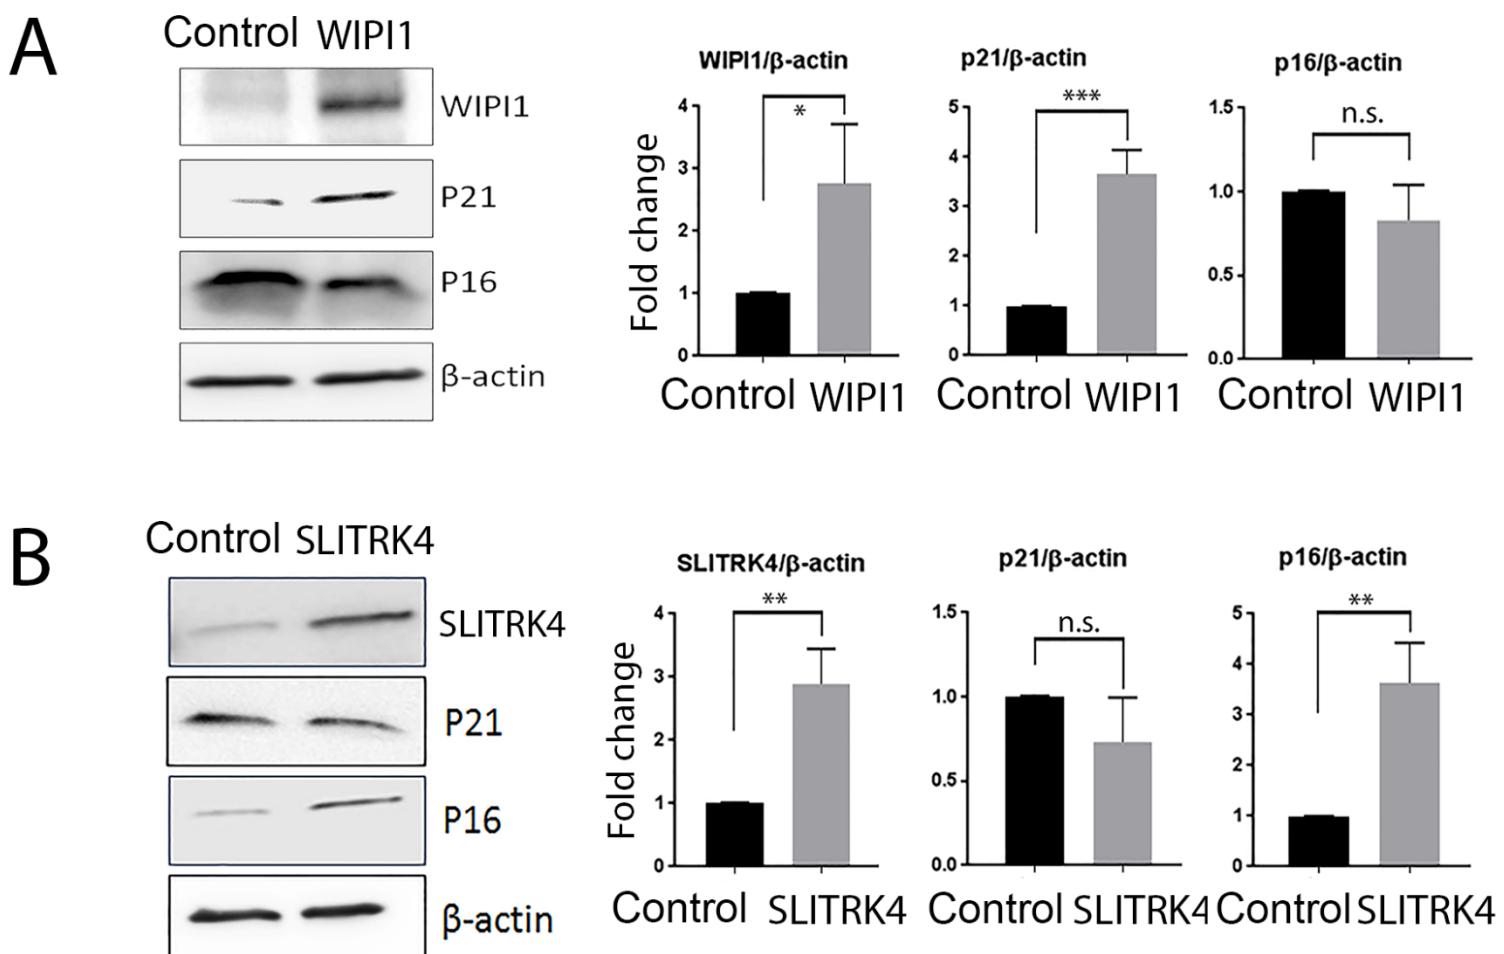

B

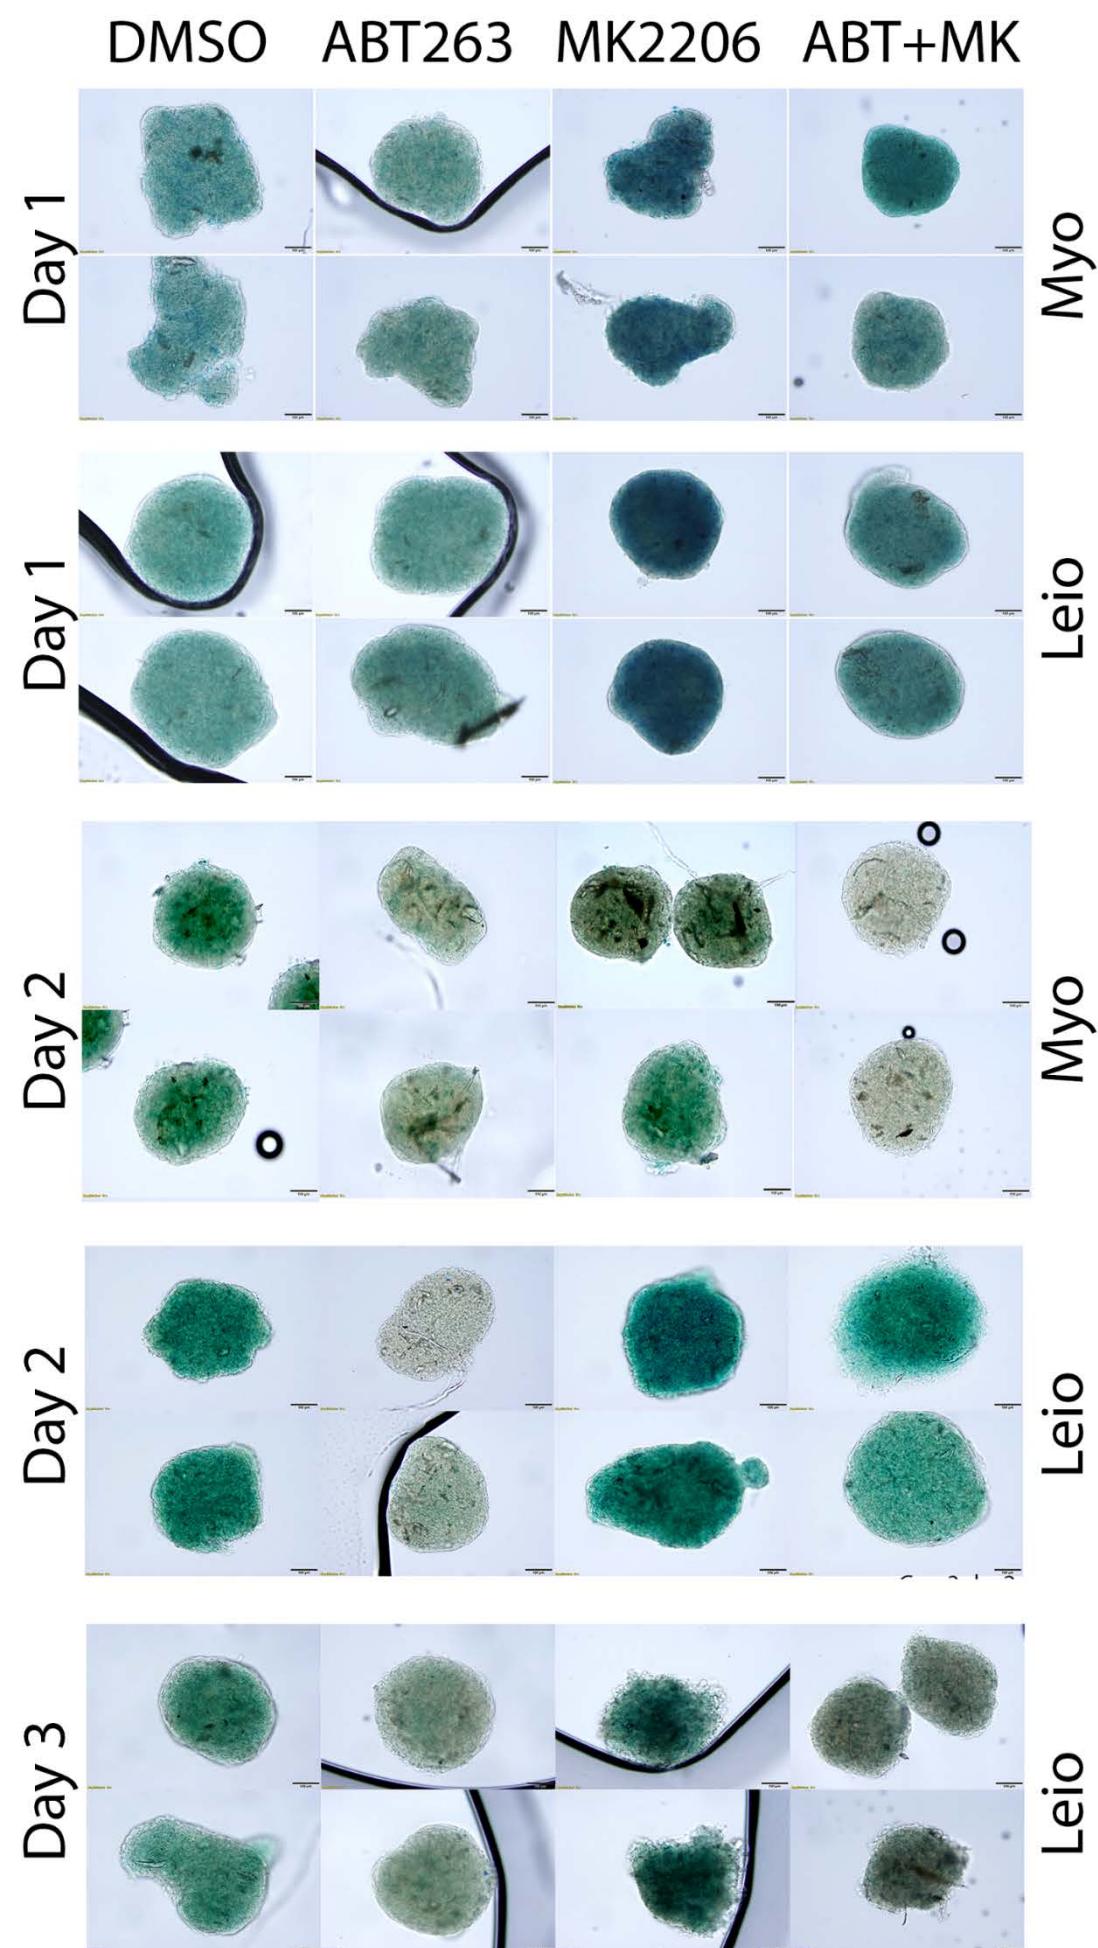

Supplementary Figure 4. RT-PCR analysis of WIPI1 (A) and SLITRK4 (B) expression in replication senescent (P0 vs. P2) and MK2206 treated leiomyoma cells. *p<0.05, **p<0.01, ***p<0.001.

S Fig. 5

Supplementary Figure 5. Western blots of P16 and P21 expression in primary leiomyoma cells with overexpression of WIPI1 and SLITRK4. The band density (right) was quantified ($n=3$) and expressed as the means \pm SD. N.s.: no significant change. * $p<0.05$, ** $p<0.01$, *** $p<0.001$.

Supplementary Figure 6. The relative levels of senescent cells (intensity of green color) detected by SA- β -gal staining in leiomyoma (Leio) and myometrium (Myo) spheroids (duplicated) cells treated by control (DMSO), ABT263, MK2206, and combined ABT263+MK2206 from day 1 to day 3.
