

Supplemental Figure 3.

Supplemental Figure 3. RAW 264.7 cells were primed with RANKL (50 ng/mL) for 2 days and then cultured for an additional two days without RANKL treatment (negative control, NC), with RANKL (50 ng/mL, positive control, PC), with human recombinant plastin-1 (rIPL), 2 (rLPL) and 3 (rTPL) at 10 μg/mL. A) Average osteoclast planar area. B) Average number of nuclei per osteoclast. Data are means ± SEM, N= 30-55 cells, *p<0.05, **p<0.01 compared to NC assessed by student's t-test.
