SUPPLEMENTAL METHODS

Generation of human induced-pluripotent stem cell (hiPSC)-derived non-cardiomyocyte cardiac cells (hiPSC-NMCCs)

The line of hiPSCs used in this study was reprogrammed from male, human, cardiac fibroblasts by transfecting the cells with Sendai viruses coding for OCT4, SOX2, KLF4, and C-MYC and then engineered to constitutively express green fluorescent protein (GFP). Cells were cultured with hiPSC growth medium in Matrigel-coated plate, and passaged every 3-4 days¹ for 15-20 passages before use in subsequent experiments.

hiPSCs were differentiated into endothelial cells (ECs) and smooth-muscle cells (SMCs) as described previously.^{2, 3} Briefly, hiPSCs were differentiated into ECs by treating the cells sequentially with 10 µM Y27632 in mTeSR, 8 µM CHIR99021, and 25 ng/mL bone morphogenic protein 4 (BMP4) with 1% B27, and 200 ng/mL vascular endothelial growth factor (VEGF) and 2 µM forskolin in StemPro34. hiPSC-ECs were purified and enriched by collecting cells that expressed both CD31 and vascular endothelial cadherin (VE-cadherin, CD144) via flow cytometry with a fluorescence activated cell sorting (FACS) apparatus. hiPSCs were differentiated into SMCs by treating the cells sequentially with 10 µM Y27632 in mTeSR, 8 µM CHIR99021, and 25 ng/mL BMP4 in N2B27 medium, and 10 ng/mL platelet-derived growth factor (PDGF)-BB and 2 ng/mL Activin A in N2B27 medium.

hiPSCs were differentiated into pericytes via a published method⁴ and then purified and enriched by collecting cells that expressed both CD44 and CD146 via flow cytometry. hiPSCs were differentiated into fibroblasts via a protocol modified from a previous publication.^{5, 6} The hiPSCs were seeded onto Matrigel-coated plates (10^4 cells/cm²) in induction media consisting of high-glucose Dulbecco's Modified Eagle Medium (DMEM-HG), 10% fetal bovine serum (FBS), 0.1 mM non-essential amino acids, 1% Antibiotic-Antimycotic, 10 µM of the anaplastic lymphoma kinase (ALK) inhibitor SB431542 (No. 04-0010), and 5 ng/mL basic fibroblast growth factor (bFGF) for 2 passages; then, the cells were transferred onto non-Matrigel-coated plates, cultured for 8 passages, and then cultured with 100 ng/mL connective tissue growth factor (CTGF) and 5 ng/mL fibroblast growth factor (FGF) for 2 weeks.

Characterization of hiPSC-derived NMCCs

Surface-marker expression

hiPSC-ECs were characterized via the expression of cluster of differentiation (CD) 31, CD144, and von Willebrand factor (VWF); hiPSC-SMCs were characterized via the expression of α -smooth muscle actin (α SMA), smooth muscle myosin heavy chain 11 (MYH11), and calponin1; hiPSC-pericytes were characterized via the expression of neural/glial antigen 2 (NG2), CD44, and CD146; hiPSC-fibroblasts were characterized via the expression of protein disulfide isomerase (PDI), discoidin domain receptor 2 (DDR2), short stature homeobox 2 (SHOX2), fibroblast marker clone TE7, platelet-derived growth factor receptor alpha (PDGFR α), and transcription factor 21 (TCF21) (Online table IV).

Flow cytometry analyses

Cells were trypsinized, resuspended as single cells, permeabilized in 0.1% Triton X-100 at 4°C for 10 minutes, blocked with UltraV block at room temperature for 7 minutes, and incubated with the indicated primary antibodies, isotype-control antibodies, and secondary antibodies; then, the cells were washed, resuspended in 2% fetal calf serum/phosphate-buffered saline containing 5 μ L of propidium iodide (10 μ g/mL), and evaluated with a FACS Aria instrument (BD Biosciences, USA).

Tube formation (ECs)

Tube formation was evaluated as previously reported.² Briefly, Matrigel solution was placed in a 24-well tissue culture plate at 37°C and allowed to solidify for one hour. hiPSC-ECs or human umbilical vein endothelial cells (hUVECs) (1.5×10^5 cells/well) were seeded onto the solidified matrix with fresh EGM 2-MV medium (containing 50 ng/mL VEGF) and incubated under standard cell culture conditions for 24 hours; then, 2 μ g/mL calcein (Fisher scientific, USA) was added to the wells and the cells were incubated for 20 minutes. Tube formation was evaluated by examining the cells under an inverted fluorescence microscope (Olympus, Japan).

Dil-conjugated acetylated low-density lipoprotein (Dil-ac-LDL) uptake (ECs)

The Dil-ac-LDL uptake assay was conducted as described previously.² Briefly, cells were incubated with 10 μ g/mL of Dil-Ac-LDL (Life Technologies, USA) at 37 °C for 6 hours, washed with Dulbecco's PBS, fixed, and counterstained with 4',6-diamidino-2-phenylindole (DAPI).

Cell contraction test (SMCs)

hiPSC-SMCs or human aortic smooth muscle cells (hASMCs) were seeded onto a gelatin-coated 6-well plate, partially detached by incubating them with a non-enzymatic

dissociation buffer (Versene, Invitrogen, USA), and then treated with 10 μ M carbachol for 5 minutes. Images were obtained 0 and 5 minutes after carbachol treatment, and contraction was evaluated by using Image J Software to measure the cells' cross-sectional surface areas.⁷

Collagen gel contraction assay (SMCs)

The gel contraction assay was performed with a cell contraction assay kit (Cell Biolabs, USA) as directed by the manufacturer's instructions. Briefly, 2×10^5 hiPSC-SMCs or hASMCs were mixed with 0.5 mL collagen gel and polymerized in one well of a 24-well culture plate; then, the gels were transferred to a 6-well plate and cultured in an incubator. Gel sizes were measured at 24-hour intervals over 3 days and quantified as a percentage of the initial area of the lattice.

Wound healing assay (fibroblasts)

The migration of hiPSC-fibroblasts or human dermal fibroblast (hDFs) was assessed via a wound healing assay. Cells were cultured until confluent in a 6-well plate; then, the monolayers were scratched with a 200 μ L pipette tip, the detached cells were removed, the remaining cells were washed, and fresh medium was added. Cell movement was recorded for 12 hours using a phase-contrast microscopy, and cell migration distance was measured with Image J software.

Adhesion assay (fibroblasts)

hiPSC-fibroblasts or hDFs were detached with 2.5 mM EDTA and resuspended in DMEM at 2.5×10^5 cells/mL; then, 50 μ L of the cell suspension was plated into each well of a 96-well microtiter plate that had been coated with 1 μ g/mL fibronectin. Plates were incubated for 30 min and then washed with PBS to remove non-adherent cells; then, adherent cells were stained with methylene blue and quantified via dye extraction and absorbance measurements at 620 nm as described previously.⁸

Osteogenic differentiation (pericytes)

hiPSC-pericytes or human brain vascular pericytes (hBVPs) (5,000 cells/cm²) were cultured in media comprised of low-glucose DMEM, 10% FBS, 1% penicillin/streptomycin, 10 mM β -glycerophosphate, 100 nM dexamethasone, and 50 μ M ascorbic acid (Sigma) for 3 weeks; then, the samples were fixed with 3.7% formaldehyde, washed, and incubated with Alizarin Red S (40 mM in DI H₂O, pH ~4.2; Sigma) for 30 minutes.⁹

Migration assay (pericytes)

Cell migration was evaluated via the Boyden-chamber assay, as previously described.¹⁰ hiPSC-pericytes or hBVPs (2×10^4 cells) were suspended in DMEM with 1% FBS in the upper chamber, and the lower chamber was filled with DMEM containing 10% FBS; then, the apparatus was incubated at 37 °C for 24 hours, and cells that had migrated to the lower membrane were counted under a light microscope.

Differentiation and characterization of myofibroblast-like cells from hiPSC-derived NMCCs

Cell culture and treatments

hiPSC-ECs were maintained in endothelial-cell growth medium (EGM) (Lonza, USA), hiPSC-SMCs were maintained in DMEM containing 5% FBS, hiPSC-pericytes were maintained in pericyte medium (PM) (Stem Cell, USA), and hiPSC-fibroblasts were maintained in fibroblast growth medium (ATCC, USA) at 37 °C with 5 % CO₂ in a humidified atmosphere. For myofibroblast differentiation, 2×10^5 hiPSC-NMCCs were seeded into Matrigel-coated 6-well plates in RPMI 1640 complete medium containing 1% B27 and 3 ng/mL TGFβ1 for 5 days. For TGFβ blocking, cells were treated for 5 days with the culture medium (control), the anti-TGFβ antibody (10 µg/mL, 1D11, R & D), or galunisertib (10 µM, Selleckchem, USA); the TGFβ-blocking agents were added to the culture medium 1 hour before TGFβ1 treatment.

ELISA

Cells were plated in 24-well plates, cultured to 70–80% confluence, and incubated for 24 hours; then, the cells were lysed, whole cell lysates were centrifuged, the supernatants were collected, and TGF-β1, interleukin-1 (IL-1), and VEGF levels were measured with the DuoSet ELISA Development kit (R&D Systems, Minneapolis, MN). Measurements were normalized to the number of cells.

Proliferation

Cells (2×10^4) were seeded onto 96-well plates containing RPMI-1640 and 0.2% B27 and cultured for 16 hours; then, proliferation was quantified using the MTT Proliferation Assay (Roche) as directed by the manufacturer's instructions.

Western blot

Cells were washed twice in cold phosphate-buffered saline (PBS) and lysed in New RIPA lysis buffer (150 mM NaCl, 50 mM Tris pH 8.0, 1 mM ethylenediaminetetraacetic acid [EDTA], 1 mM egtazic acid [EGTA], 0.5% sodium deoxycholate, 0.1% sodium

dodecyl sulfate [SDS], and 1% Triton X-100) with protease inhibitors (0.1 M phenylmethylsulfonyl fluoride, 5 µg/mL leupeptin, 2 µg/mL aprotinin, and 1 µg/mL pepstatin). Protein concentrations for the whole-cell lysates were determined via the bicinchoninic acid (BCA) assay, and equal amounts of each protein sample (15 µg) were separated on an 8-14% SDS-polyacrylamide gel at 80 V; then, a Turbo transfer System (Bio-Rad, USA) was used for 8 minutes to transfer the separated proteins to a polyvinylidene difluoride membrane, and the proteins were blocked with 5% skim milk powder for 1 hour at room temperature. Membranes were incubated with primary antibodies for 1 hour at room temperature or overnight at 4 °C, washed three times with 0.05% PBS-Tween, incubated for 1 hour at room temperature with a horseradish peroxidase-conjugated secondary antibody, and washed with 0.05% PBS-Tween; then, the protein bands were visualized with ECL Plus as directed by the manufacturer's instructions and developed on film (Cell signaling, USA).

Real-time reverse transcription PCR

Total RNA was extracted with the RNeasy mini-kit (Qiagen). PCR reactions were conducted on a Realplex² Real-Time PCR system (Eppendorf, USA) with 25 µL iScript92 RT-PCR Reaction Mix (Bio-Rad), 1 µL iScriptreverse transcriptase, 900 nM forward primer, 900 nM reverse primer, 250 nM probe, and 50 ng RNA in 50 µL. Primers are listed below.

Vimentin: F: 5'-ATCTGGATTCACTCCCTCTGGTT-3', R: 5'-GTGATGCTGAGAAGTTT-CGTTGATA-3';

TGFβ receptor 1: F: 5'-GCTGTGAAGCCTTGAGAGTAATGG-3', R: 5'-TTCCTGTTGA-CTGAGTTGCGATAA-3';

Macrophages

Macrophages were generated from the human monocyte cell line U937. The U937 cells were maintained with RPMI 1640 medium containing 10% FBS, and monocyte differentiation was induced by treating the cells with 20 nM phorbol myristate acetate (PMA) in RPMI 1640 medium for 16 hours; then, the medium was replaced with fresh medium, and the cells were differentiated into macrophages over the ensuing 3 days.

Murine myocardial infarction (MI) models and treatment

All experimental procedures that involved animals were approved by the Institutional Animal Care and Use Committee of the University of Minnesota, performed in accordance with the Animal Use Guidelines of the University of Minnesota, and consistent with the National Institutes of Health Guide for the Care and Use of Laboratory Animals (NIH publication No 85-23). Twelve-week-old immunodeficient male and female (an equal number of each sex) NOD-scid/yc^{-/-} mice (Jackson Laboratory) were anesthetized with inhaled isofluorane (1.5-2%), intubated, and ventilated with a small animal respirator (Harvard Apparatus); then, a left thoracotomy was performed to expose the heart, and MI was induced by permanently ligating the left-anterior descending coronary artery with an 8.0 surgical silk suture.¹¹ After closing the chest muscles and skin, animals were administered buprenorphine (0.1 mg/kg, intraperitoneal injections) every 24 hours for up to three days and carprofen (5 mg/kg, intraperitoneal injections) every 24 hours for up to one day after surgery.

Two separate experiments were conducted. In experiment 1, the mice were randomly divided into eight groups (MI+ECs, MI+ECs+Gal, MI+SMCs, MI+SMCs+Gal, MI+PCs, MI+PCs+Gal, MI+FBs, and MI+FBs+Gal), and the experimental treatment was administered 15 minutes after MI was induced. In experiment 2, the animals were allowed to recover for 1 week after MI induction and then randomly divided into four groups (MI, MI+Cells, MI+Gal, and MI+Cells+Gal) before the chest was re-opened and the treatment was administered. Animals in the MI+EC group, the MI+SMC group, the MI+PC group, and the MI+FB group were treated with hiPSC-ECs, -SMCs, -pericytes, and fibroblasts, respectively (3×10^5 cells/mouse); animals in the MI+EC+Gal, MI+SMC+Gal, MI+PC+Gal, and MI+FB+Gal groups were treated with the indicated hiPSC-NMCCs (3×10^5 cells/mouse) and the TGF β receptor 1 inhibitor galunisertib; animals in the MI+Cells group were treated with a combined population of all four NMCC types (0.75×10^5 of each cell type); animals in the MI+Gal group were treated with galunisertib; animals in the MI+Cells+Gal group were treated with the combined NMCC population (0.75×10^5 of each cell type) and galunisertib; and animals in the MI group recovered without any of the experimental treatments. The cells were injected into three sites of the heart (1×10^5 cells per injection site); one site was located in the infarcted region, and two were located in the region surrounding the infarct. Galunisertib (75 mg/kg per day) was administered orally until the animals were sacrificed at day 7 (experiment 1) or week 4 (experiment 2) after MI. Animals in the Sham group underwent all the surgical procedures for MI induction except the ligation step and recovered without either experimental treatment. Mice that died or displayed no decline in heart function one week after MI was induced were excluded from subsequent analyses, and all assessments were performed in a blinded manner.

Swine MI model

Assessments of hiPSC-NMCC–myofibroblast-like cell differentiation were also conducted in the infarcted hearts of Yorkshire swine (14 kg, 45 days of age, Snyder Farms, Birmingham); because the hiPSC-NMCCs were derived from the cells of male humans, the experiments were performed with female animals to enable the transplanted cells to be identified via expression of the human Y chromosome as described previously.^{12, 13} Briefly, MI was induced by occluding the left anterior descending coronary artery for 60 minutes; then, the hearts were reperfused, and the animals were treated with 2.5×10^6 hiPSC-ECs and 2.5×10^6 hiPSC-SMCs (5×10^6 cells total). The cells were injected directly into the injured myocardium, the chest was closed in layers, and the animals were allowed to recover. Hearts were harvested from all surviving animals and sectioned 4 weeks after treatment.

Echocardiographic assessments of cardiac function

Echocardiographic measurements were obtained as recommended by the American Society of Echocardiography and performed on a Vevo 2100 Imaging System (Visual Sonics Inc, Canada); Briefly, mice were lightly anesthetized with 1.5-2% isofluorane until the heart rate stabilized at 400 to 500 bpm; then, both conventional 2-dimensional images and M-Mode images of the heart were acquired in a parasternal short axis view. Vevo Analysis software was used to calculate left ventricular (LV) ejection fraction (EF) and fractional shortening (FS).¹ All assessments were performed in a blinded manner.

Immunohistochemical evaluations

Hearts were collected and frozen at the optimal temperature for cryo-sectioning. Embedded tissues were cut into 10-µm sections; then, the sections were fixed with 4% paraformaldehyde for 20 min at room temperature, permeabilized in 0.1% Triton X-100 at 4 °C for 20 minutes, and blocked with UltraV block (Thermo Scientific, USA) for 7 min. Primary antibodies (Online table IV) were added to the UltraV block buffer, and the sections were incubated at 4 °C. On the following day, secondary antibodies conjugated with fluorescent markers (Jackson ImmunoResearch Lab, USA) were added; then, the sections were incubated for 1 hour at room temperature, stained with DAPI, washed, and examined under a confocal microscope (Zeiss 710, USA).

Vascular density was evaluated by counting the number of vascular structures that were positive for either CD31 or α SMA expression; then, the images used for the CD31 and α SMA evaluations were superimposed, and arteriole density was evaluated by counting the number of structures that expressed both CD31 and α SMA. Cells and vessels were counted in 5 fields per section, 6 sections per animal.

Infarct size measurement

Hearts were frozen and cut into 10-µm sections; then, the sections were stained with an Accustain Trichrome Stains (Masson) kit (Sigma-Aldrich, USA). LV fibrotic area and total LV area of each image were measured using Image J, and the fibrotic area was reported as a percentage of the total LV area. Measurements were performed in three separate regions of each heart, one located just below the ligation suture, another located midway between the ligation suture and the apex, and a third located close to the apex; then, the three measurements were averaged.

Engraftment rate assessment

Engraftment rates were evaluated via quantitative PCR (qPCR) assessments of the human Y-chromosome as previously reported.¹³ Briefly, whole hearts of female mice were collected and digested overnight at 56 °C with proteinase K; then, the total DNA was isolated from the digested buffer with a QIAGEN DNA isolation kit. The number of cells in each mouse heart was determined by comparing the number of cycles required for each sample to a standard curve calculated from the DNA of known quantities of undifferentiated hiPSCs, and the engraftment rate was calculated as the number of cells in each animal divided by the number of cells administered (3×10^5). Analyses were performed with the SYBR Green kit (Thermo Scientific, USA) on an Eppendorf Realplex² PCR system (Eppendorf, USA) with the following primers: sense, ATCAGCCTAGCCTGTCTT-CAGCAA; anti-sense, TTCACGACCAACAGCACAGCAATG.

Proteomics analysis with isobaric tagging for relative and absolute quantification (iTRAQ), strong cation exchange (SCX) chromatography, LC-MALDI and 4800 MS/MS, and peptide and protein identification

Samples were desalted and serially diluted with bovine serum albumin (1 mg/mL); then, protein concentrations were determined with Bradford reagent (Bio-Rad, Hercules, CA) and absorbance measurements at 590 nm. Equal amounts (20 µg) of protein from each cell lysate were labeled with iTRAQ™ reagents (113, 114, 115, 116, 117, 118, 119, and 121; ABI, Foster City, CA) as directed by the manufacturer's protocol and as described previously.¹⁴ Samples were analyzed in triplicate via tandem (MS/MS) time-of-flight (TOF) mass spectroscopy. Peptide/protein isolation and identification were conducted as described previously.¹⁴

Proteomics analysis with myofibroblast-like cells medium

Cells were cultured in serum-free RPMI medium at 50-75% confluence. The medium was changed and collected every 48 h and concentrated; then, the proteins in the medium were separated on an SDS-polyacrylamide gel and stained with Commassie Blue (Gelcode blue safe catalog 1892657, Thermo Fisher Scientific). Protein bands were excised, destained, and digested in-gel with trypsin; then, the peptides were resuspended in 98:2 water/acetonitrile, 0.1% formic acid and run on an OrbitrapVelos (Thermo Fisher Scientific) mass spectrometer. Data (MS/MS and protein inference) were interpreted by analyzing the tThermo RAW files with Peaks Studio 7.0 build 20140912 (Bioinformatics Solutions) software.

Ingenuity pathway analysis (IPA)

Proteins were imported into the IPA software (<http://www.ingenuity.com>, 2016, May), and the number of genes associated with each biological pathway, function, or disease were counted; p values were calculated via the Fisher's exact test.

Statistical analysis

Data distribution was evaluated with the Shapiro-Wilk normality test. For normally distributed data, values are presented as mean±standard error of the mean (SEM), and comparisons between two groups were performed with the two-tailed Student's *t*-test; ANOVA or repeated ANOVA and the Tukey post-hoc test were used for multiple comparisons or repeated measurements. For non-normally distributed data, values were presented as median (25th, 75th percentile) in box plots, the overall difference in distribution among multiple groups was determined by using the Kruskal-Wallis test, and post-hoc comparisons were performed with the Dunn test. Statistical analyses were performed with SPSS software (version 20.0), and $P<0.05$ was considered statistically significant.

ONLINE FIGURE LEGENDS

Online Figure I. Immunofluorescent analysis of marker expression in human iPSC-derived non-cardiomyocyte cardiac cells (hiPSC-NMCCs).

hiPSCs were differentiated into endothelial cells (hiPSC-ECs), smooth-muscle cells (hiPSC-SMCs), fibroblasts (hiPSC-FBs), and pericytes (hiPSC-PCs); then, hiPSC-ECs were evaluated for the expression of CD31 but not MYH11, TE7, and NG2; hiPSC-SMCs were evaluated for the expression of MYH11 but not CD31, TE7, and NG2; hiPSC-fibroblasts were evaluated for the expression of TE7 but not CD31, MYH11, and NG2; hiPSC-pericytes were evaluated for the expression of NG2 but not CD31, MYH11, and TE7. Nuclei were counterstained with DAPI. Bar=100 μ m.

Online Figure II. Immunofluorescent analysis of specific marker expression in human native cells.

Human umbilical vein endothelial cells (hUVECs) were evaluated for the expression of CD31, CD144, and von Willebrand factor (VWF); human aortic smooth muscle cells (hASMCs) were evaluated for the expression of α -smooth muscle actin (α SMA), smooth muscle myosin heavy chain 11 (MYH11), and calponin1; human dermal fibroblasts (hDFs) were evaluated for the expression of fibroblast marker clone TE7, platelet-derived growth factor receptor alpha (PDGFR α), and transcription factor 21 (TCF21); and human brain vascular pericytes (hBVPs) were evaluated for the expression of CD44, neural/glial antigen 2 (NG2), and CD146. Nuclei were counterstained with DAPI. Bar = 100 μ m.

Online Figure III. Functional assessments of both human somatic and hiPSC-derived ECs, SMCs, pericytes, and FBs.

(A) hiPSC-ECs and hUVECS were suspended in EGM 2-MV medium supplemented with 50 ng/mL VEGF and then plated on Matrigel; 24 hours later, the cells were labeled with calcein for 20 mins, and then tube formation was evaluated under a light microscope (bar = 100 μ m). (B) The uptake of Dil-conjugated acetylated low-density lipoprotein (Dil-ac-LDL) was evaluated in hiPSC-ECs and hUVECs; nuclei were counterstained with DAPI (bar = 100 μ m). (C) hiPSC-SMCs and hASMCs were treated with carbachol to induce contraction, and images were obtained 0 and 5 mins later. Contraction was evaluated by calculating the mean cell surface area at each of the two time points. (D) Collagen gels containing hiPSC-SMCs or hASMCs were prepared, and the surface areas of the gels were measured 0 and 3 days later. Contractile activity was calculated as the ratio of day 3 and day 0 measurements (day 3/day 0) and expressed as a percentage. (E) Migration of hiPSC-fibroblasts (FBs) and hDFs was evaluated via the wound-healing assay. Cells

were grown to confluence; then, the monolayers were scratched with a pipette tip, and migration distances were measured 0 and 12 hours later. (**F**) Cell adhesion assays were performed with hiPSC-fibroblasts and hDFs. The cells were plated on microtiter wells coated with fibronectin (1 µg/mL), adherent cells were fixed and stained with methylene blue, and the extracted dye was quantified by absorbance at 620 nm. (**G**) The osteogenic differentiation potential of hiPSC-pericytes (hiPSC-PCs) and hBVPs was assessed via Alizarin Red S staining. Bar=100 µm. (**H**) The migration of hiPSC-pericytes and hBVPs was evaluated via the Boyden-chamber assay. Cells that had migrated to the lower chamber were counted 24 hours later (n=3 independent experiments).

Online Figure IV. TGF β activates Smad3, Snail1, and mTOR signaling during hiPSC-NMCC–myofibroblast-like cell differentiation. hiPSC-ECs, -SMCs, -pericytes (PCs), and -fibroblasts (FBs) were cultured with TGF β 1 (3 ng/mL), with a TGF β -blocking antibody (10 µg/mL, AB), with galunisertib (10 µM, G), which blocks the TGF β receptor 1, with TGF β 1 and a TGF β -blocking antibody (TGF+AB), with TGF β 1 and galunisertib (TGF+G), or without any experimental treatment (Con); then, (**A**) Snail1, (**B**) mTOR, and (**C**) Smad3 mRNA (left panels) and/or protein (right panels) levels were evaluated via quantitative RT-PCR and Western blot, respectively; (**D**) phosphorylated Smad3 (p-Smad3) were evaluated via Western blot (left panel: summarized results, right panel: representative immunoblots). β -actin protein levels were also evaluated via Western blot to confirm equal loading. *P<0.05, **P<0.01 versus Control, TGF+AB, and TGF+G; One-way ANOVA followed by Tukey post-hoc test. n=3 independent experiments.

Online Figure V. Protein expression in hiPSC-NMCC–myofibroblast-like cells (MFLCs) can vary depending on NMCC lineage. Protein expression in hiPSC-EC-, -SMC-, -pericyte (PC)-, and -fibroblast (FB)-MFLCs was evaluated via iTRAQ LC-MS/MS. Data are summarized for proteins involved in (**A**) fibrosis and remodeling, (**B**) proliferation, and (**C**) apoptosis. IGFBP7: insulin-like growth factor binding protein 7; SERPINE1:serpin peptidase inhibitor, clade E (nexin, plasminogen activator inhibitor type 1), member 1; NAMPT: nicotinamide phosphoribosyltransferase; SERPINE2: serpin peptidase inhibitor, clade E (nexin, plasminogen activator inhibitor type 1), member 2; LGALS3: galectin-3; COL8A1: collagen type VIII alpha 1 chain; THBS1: thrombospondin 1; GSN: gelsolin; COL12A1: collagen type XII alpha 1 chain; TGFBI: transforming growth factor beta Induced; VCAN: versican; POSTN: periostin; TNC: tenascin C; ARPC1A: actin related protein 2/3 complex subunit 1A; TCERG1:

transcription elongation regulator 1; HMGB1: high mobility group box 1; SMARCA4: SWI/SNF related, matrix associated, actin dependent regulator of chromatin, subfamily A, member 4; MTA2: metastasis associated 1 family member 2; CBFB: core-binding factor beta subunit; GTF2I: general transcription factor Iii; ILF2: interleukin enhancer binding factor 2; ACTN4: actinin alpha 4; PTRF: polymerase I and transcript release factor; CALR: calreticulin; FHL2: four and a half LIM domains 2; STAT6: signal transducer and activator of transcription 6; STAT1: signal transducer and activator of transcription 1; BZW1: basic leucine zipper and W2 domains 1; CIRBP: cold inducible RNA binding protein; EEF1B2: eukaryotic translation elongation factor 1 beta 2; EIF2S3: eukaryotic translation initiation factor 2 subunit gamma; EIF4E: eukaryotic translation initiation factor 4E; EIF4G1: eukaryotic translation initiation factor 4 gamma 1; EIF5A: eukaryotic translation initiation factor 5A; GCN1: EIF2 alpha kinase activator homolog; GSPT1: G1 To S phase transition 1; GF2BP1: insulin like growth factor 2 mRNA binding protein 1; IGF2BP3: insulin like growth factor 2 mRNA binding protein 3; LARP1: la ribonucleoprotein domain family member 1. * $P<0.05$, ** $P<0.01$ for comparisons across all four hiPSC-NMCC–MFLCs populations; One-way ANOVA followed by Tukey post-hoc test.

Online Figure VI. Pathway activation in hiPSC-NMCC–myofibroblast-like cells (MFLCs) can vary depending on the NMCC lineage. The results from proteomics analyses were evaluated with Ingenuity Pathway Analysis software to identify pathways that were more (red) or less (blue) active in hiPSC-pericyte (PC)–, -SMC–, -EC–, and -fibroblast (FB)–MFLCs than in the cells from which they were differentiated.

Online Figure VII. Conditioned medium from hiPSC-NMCC–myofibroblast-like cells (MFLCs) promotes macrophage migration and cytokine production. (A) Macrophages were seeded in the upper chamber of a cell-migration apparatus, and the lower chamber was filled with DMEM (Control) or with conditioned medium from hiPSC-EC–, -SMC–, -pericyte–, or -fibroblast–MFLCs (EC-M, SMC-M, PC-M, or FB-M, respectively). Six hours later, cells that had migrated to the lower chamber were counted and expressed as a percentage of the number of seeded cells. **(B-D)** Macrophages were cultured with Control or SMC-M for 24 hours; then, **(B)** mRNA levels of CXCL1, CXCL6, CXCL8, and vascular endothelial growth factor (VEGF) were evaluated via quantitative RT-PCR and normalized to GAPDH mRNA levels, and **(C)** IL-1 and **(D)** VEGF protein levels were measured via ELISA. * $P<0.05$, ** $P<0.01$; One-way ANOVA followed by Tukey post-hoc test for **A**; Two-tailed Student's *t*-test for **B, C, D**. n=3-4 independent experiments.

Online Figure VIII. Conditioned medium from hiPSC-NMCC–myofibroblast-like cells (MFLCs) promotes collagen, vimentin, and αSMA expression in NMCCs. A combined population of NMCCs was cultured with TGFβ1, with conditioned medium (CM) from (A) hiPSC-EC– MFLCs (B) -pericyte (PC)–MFLCs or (C) -fibroblast (FB)–MFLCs, with CM and an anti-TGFβ antibody (CM+Ab), with CM and galunisertib (CM+G), or without any experimental treatment (Con); then, Col1α1, VMT, and αSMA mRNA levels were evaluated via quantitative RT-PCR (left panels), and Col1α1, VMT, and αSMA protein levels were evaluated via Western blot (right panels). GAPDH protein levels were evaluated via Western blot to confirm equal loading. n=3 independent experiments. *P<0.05, **P<0.01 versus Control, CM+AB, and CM+G; One-way ANOVA followed by Tukey post-hoc test.

Online Figure IX. hiPSC-ECs and -SMCs can differentiate into myofibroblast-like cells (MFLCs) after transplantation into infarcted swine hearts. Swine were injected with GFP-labelled hiPSC-SMCs and -ECs after experimentally induced MI, and sacrificed four weeks later; then, marker expression was evaluated in sections from the site of cell administration via immunofluorescence. (A) Engrafted cells that retained their SMC phenotype were identified via GFP and MYH11 co-expression; (B) Engrafted cells that retained their EC phenotype were identified via hCD31 expression; and engrafted cells that had differentiated into MFLCs were identified via (C) hVMT and αSMA, or (D) hCalponin 1 and VMT co-expression. Cardiomyocytes were visualized by staining for cTnI, and nuclei were counter-stained with DAPI. Bar=100 μm. n=4 pigs.

Online Figure X. TGFβ inhibition does not improve the engraftment of transplanted hiPSC-NMCCs. MI was surgically induced in mice; one week later the animals were treated with transplanted hiPSC-NMCCs (0.75×10^5 of each of the four cell types) (the MI+Cells group) or with both transplanted hiPSC-NMCCs and orally administered galunisertib (the MI+Cells+Gal group). Engraftment was measured at week 4 after injury (i.e., 3 weeks after cell administration), via quantitative PCR assessments of human Y-chromosome expression. n=5 mice per group.

ONLINE TABLE LEGENDS

Online Table I. Protein expression in hiPSC-EC-, -SMC-, -pericyte-, and -fibroblast-myofibroblast-like cells (MFLCs)

Lysates of hiPSC-EC-, -SMC-, -pericyte-, and -fibroblast-MFLCs were evaluated via proteomics analysis and iTRAQ for protein identification and quantification. Results from each lineage subpopulation were compared against those from a blend of hiPSC-ECs, -SMCs, -pericytes, and -fibroblasts. The iTRAQ data was normalized and processed as described before.¹⁴ Proteins with at least 2 unique peptides and ≥99% confidence with relative abundance were included in the list.

Online Table II. Protein function and signal transduction analysis

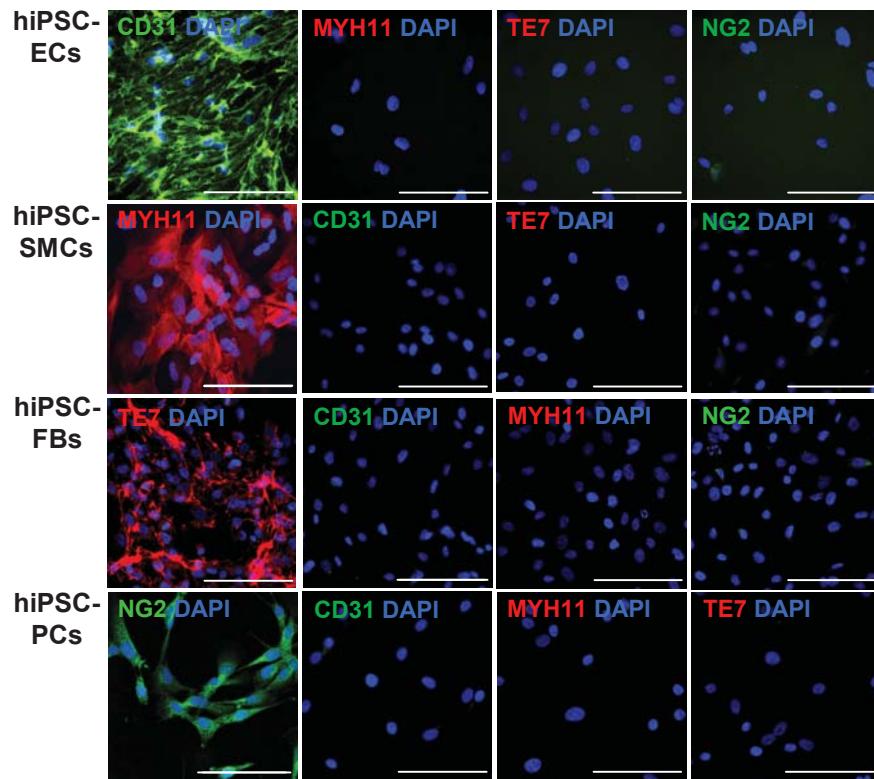

Proteins common among the hiPSC-EC-, SMC-, pericyte-, and fibroblast-derived myofibroblast-like cells were analyzed with the Ingenuity Pathway Analysis program to identify their corresponding signal transduction pathways and cellular functions. Results were compared against the Ingenuity Knowledge Base and in function analysis the relationship of gene (protein) includes direct and indirect.

Online Table III. hiPSC-NMCC-myofibroblast-like cell secretomes

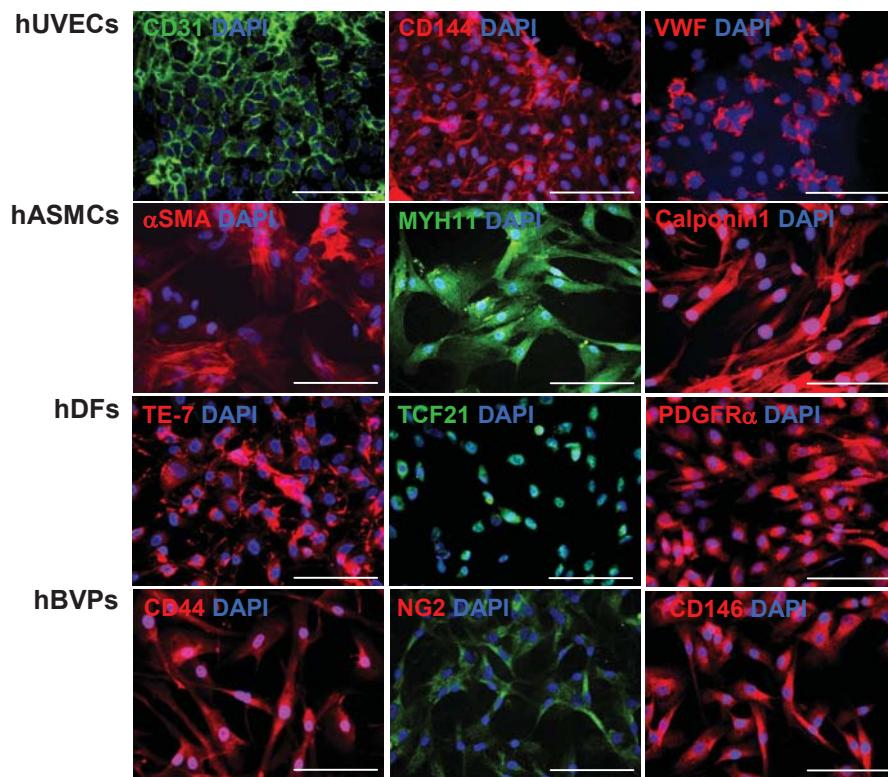

Proteins in conditioned medium were identified via the proteomics method on an Orbitrap Velos (Thermo Fisher Scientific) mass spectrometer. Concentrated proteins in cell culture medium were loaded and run on an SDS-PAGE gel; then, the protein bands were cut out, and the proteins were identified and processed as described in the Online Methods. Only proteins identified with two or more unique peptides with ≥99% confidence have been included.

Online Table II. The Differentiated Protein Function and Signal Transduction Analysis with Ingenuity Pathway Analysis

The differentiated proteins in common among the four cell lines were analyzed with Ingenuity Pathway Analysis program and signal transduction and cell function result listed below (2018, March).

Top Canonical Pathways

Name	p-value	Overlap
EIF2 Signaling	1.62E-57	64.6 % 137/212
Regulation of eIF4 and p70S6K Signaling	1.06E-37	61.7 % 95/154
Protein Ubiquitination Pathway	2.76E-25	42.8 % 113/264
mTOR Signaling	8.51E-25	47.2 % 93/197
Mitochondrial Dysfunction	4.60E-21	47.3 % 78/165

Top Upstream Regulators

Upstream Regulator	p-value of overlap	Predicted Activation
CST5	8.48E-46	Inhibited
MMP12	1.24E-28	
LONP1	6.29E-26	
mir-122	5.53E-22	
PLA2R1	3.17E-20	Inhibited

Top Diseases and Bio Functions

Diseases and Disorders

Name	p-value	#Molecules
Infectious Diseases	1.02E-04 - 1.13E-49	581
Metabolic Disease	4.85E-05 - 1.97E-24	431
Hereditary Disorder	9.26E-05 - 3.78E-20	818
Organismal Injury and Abnormalities	9.87E-05 - 3.78E-20	2991
Skeletal and Muscular Disorders	4.85E-05 - 3.78E-20	644

Molecular and Cellular Functions

Name	p-value	#Molecules
Protein Synthesis	6.12E-05 - 4.28E-50	489
RNA Post-Transcriptional Modification	6.00E-05 - 2.34E-49	166
Gene Expression	3.51E-05 - 1.15E-34	434
Cell Death and Survival	8.43E-05 - 1.32E-33	865
Cellular Assembly and Organization	8.42E-05 - 2.57E-27	502

Physiological System Development and Function

Name	p-value	#Molecules
Organismal Development	4.14E-06 - 2.09E-13	195
Organismal Survival	7.72E-11 - 7.72E-11	149
Tissue Development	8.33E-05 - 1.26E-10	173
Connective Tissue Development and Function	8.33E-05 - 4.02E-07	115
Skeletal and Muscular System Development and Function	4.02E-07 - 4.02E-07	39

Top Tox Functions

Assays: Clinical Chemistry and Hematology

Name	p-value	#Molecules
Decreased Levels of Albumin	4.08E-01 - 2.58E-02	3
Increased Levels of Albumin	1.61E-01 - 5.65E-02	3

Cardiotoxicity

Name	p-value	#Molecules
Cardiac Hyperplasia/Hyperproliferation	1.61E-01 - 5.53E-04	5
Cardiac Damage	2.95E-01 - 8.51E-04	16
Cardiac Dilation	5.03E-01 - 1.60E-03	47
Cardiac Arrhythmia	1.00E00 - 2.30E-02	39

Online Table III: Protein profile of MFLC secretome

Proteins were processed as described in method and the protein identified with two and more unique peptide 99% or more confidency.
