

Supplemental Table 4. Mammary tumor transcripts differentially regulated by virulent sectional metastasis at $Q < 0.05$, $n = 66$ microarrays). The gene expression data from individual mammary tumor samples were ordered such that 25% (33 samples) of the total samples came from mice with no surface- or section- metastatic lesions and the longest tumor onset. Gene expression data from these 33 samples served as the reference group when paired with the gene expression data of 33 mammary tumor samples from mice that had the most sectional metastatic lesions detected (AMD66). Annotation was performed with Ingenuity Pathway Analysis Knowledge Base.

*Positive fold change is significant fold change increase in gene expression from mammary tumors with virulent sectional metastasis relative to mammary tumors with no metastasis.
Negative fold change is significant fold change increase in gene expression from mammary tumors with no metastasis relative to mammary tumors with virulent sectional metastasis.

†Identification of transcript by RefSeq or Illumina probe ID where RefSeq was not available.

‡Highlights significant transcripts that appear in duplicate due to the redundancy of transcript representation on Illumina Bead Chips.

§Official symbolic name of transcript
