Supplemental materials and methods

Influence of dietary *N*-acetylcysteine supplementation: Following quantification of the impact of *E. tenella* infection on *C. jejuni* load in the caeca, liver, and spleen, the mucus-thinning food supplement *N*-acetylcysteine (NAC, Sigma-Aldrich) (7, 8) was mixed with the standard diet to investigate association between *Eimeria* induced mucogenesis and *C. jejuni* load. Briefly, groups of eight individually caged Light Sussex chickens were either left unexposed to NAC (Groups 1-3; NAC-) or received 5 g NAC per Kg feed from 13 days of age (Groups 4-6; NAC+ (9)). Co-infection schedules included mock challenge with sterile MH broth at 18 days of age (Groups 1 and 4; E-/C-), $\sim 10^8$ CFU *C. jejuni* at 18 days of age (Groups 2 and 5; E-/C+) or 4,000 sporulated *E. tenella* Wis oocysts at 13 days of age plus $\sim 10^8$ CFU *C. jejuni* at 18 days of age (Groups 3 and 6; nE+/C+). All chickens were culled three days post bacterial challenge (21 days of age) and samples collected as described for trial 1. Intestinal sections were collected for periodic acid–Schiff (PAS) staining to assess the influence of NAC supplementation on mucosubstances within the intestinal lumen.

Supplementary Table 2. *Campylobacter jejuni* and *Eimeria tenella* dose regimes and viable counts from single and co-infection of chickens fed diets with or without *N*-acetylcysteine (NAC).

Group	NAC	<i>E. tenella</i> (dose; age at dosing)	Log_{10}	<i>C. jejuni</i> CFU dose (d18)	Log_{10}	output oocysts/bird	Log_{10} CFU/g Day 21 (three days post <i>C. jejuni</i>)		
							Caeca	Liver	Spleen
nE+/C+	-	Wis (4,000; d13)	8.27		6.89 ± 0.08^a	7.51 ± 0.68^b	2.14 ± 0.54^b	2.05 ± 0.43^b	
nE-/C+	-	None	8.27		nd	6.55 ± 0.22^a	3.17 ± 0.11^a	2.89 ± 0.25^a	
nE-/C-	-	None		Mock	nd	nd	nd	nd	
nE+/C+	+	Wis (4,000; d13)	8.27		6.91 ± 0.10^a	5.91 ± 0.66^a	1.32 ± 0.38^c	1.69 ± 0.38^c	
nE-/C+	+	None	8.27		nd	5.82 ± 0.58^a	2.49 ± 0.19^b	2.30 ± 0.23^b	
nE-/C-	+	None		Mock	nd	nd	nd	nd	

nE = non-attenuated *E. tenella* Wis, C = *C. jejuni*, + = administered, - = not administered, nd = none detected. Averages (\pm SD, shown in italics) that were significantly different within each trial are identified by a different superscript letter ($p < 0.05$). Mock = no bacterial control.
