

**Figure S2.** The cytokine level in plasma collected from mock infection (white bars), infected (black bars) and infected + FCPLJ (checkered bars) AG129 mice groups at day 3 and day 5 post-infection were analyzed by Procartaplex immunoassay. The treated group was given 500 mg/kg BW of FCPLJ. Bars represent the mean values  $\pm$  SEM. The cytokine level was compared between experimental groups using ANOVA multiple comparison test. There was no significant difference between observed groups.
