## **Supplementary Materials and Methods**

**RNA-seq and RT-qPCR.** Total RNA was extracted from parasites using Trizol (Life Technologies) according to the manufacturer's instructions. Total RNA was dissolved in RNase-free water for downstream use. The mRNA-seq library was constructed by KAPA Stranded mRNA-seq Kit (KAPA biosystems, KK8420) according to the manufacturer's instructions. Barcoded libraries were pooled and sequenced with read lengths (2 x 150 nt) on the HiSeq X Ten machine (Illumina, CA). For RT-qPCR, cDNA was synthesized using the FastQuant RT kit (Tiangen). Primer sequences for *var* genes were from a previous report (1). qPCR was performed on the ABI 7900 system with an initial denaturing at 95°C for 5 min, followed by 40 cycles of 10 s at 95°C, 20 s at 50°C and 30 s at 60°C. The housekeeping gene *arginyl-tRNA synthetase* (PF3D7\_0913900) was used as internal control.

**Western blot analysis.** Parasite pellets were released from infected red blood cells (iRBC) with 0.15% saponin and then lysed in lysis buffer containing NP40. After centrifugation, the supernatant was mixed with SDS-PAGE loading buffer, separated in SDS-PAGE and transferred to PVDF membrane. Immunodetection was carried out using anti-Flag (Abmart), anti-GFP (Abcam), anti-H3 (Abcam), anti-TY1 (Genscript), anti-Actin (Abclonal) followed by secondary antibodies conjugated to HRP (Jackson Immuno Research Laboratories). Chemiluminescent HRP substrate Immobilon Western kit (Millipore) was used to develop blots.

**DNA fluorescence in situ hybridization (DNA-FISH).** DNA-FISH was carried out as previously reported (2). Briefly, parasites were synchronized at the ring stage, released from iRBC with 0.15% saponin and fixed with 4% paraformaldehyde, deposited on slides, and then permeabilized with 0.25% Triton X-100. *P. falciparum* DNA on the slides was then denatured, hybridized with probes at 37°C for 22 hr and washed with a series of buffers. Probes used for this study were amplified with primers shown in *SI Appendix* Table 3, labeled with respective fluorescence by using Biotin High Prime kit and

Fluorescein High Prime kit (Roche). Slides were observed under the Olympus FV-1200 microscope.

**Chromatin immunoprecipitation (ChIP).** The ChIP assay was performed as previously described (3). Briefly, iRBCs were fixed with 1% formaldehyde solution (Thermo) at room temperature for 10 min and stopped by addition of 125 mM glycine at room temperature for another 5 min. Parasites were released by using 0.15% saponin. Chromatin was sheared to a size range between 300 bp to 600 bp by Bioruptor UCD-200 (Diagenode). Antibodies against Flag (Sigma), GFP (Abcam) and H3K9me3 (Abcam) were used in this assay. DNA from the ChIP assay was used for constructing high-throughput sequencing libraries (ChIP-seq library) followed by sequencing on the HiSeq X Ten machine. ChIP-qPCR assay used the same aliquot of immunoprecipitated DNA and detected on the ABI 7900 system. Primers for H3K9me3 ChIP-qPCR are shown in *SI Appendix* Table 3.

**Next-generation sequencing and data analysis.** Both ChIP-seq and RNA-seq raw reads were first accessed and filtered using FASTQC (v0.11.7) and trim galore (0.4.4\_dev) tools to remove the low-quality reads (quality score < 20), sequencing adaptors and the first 3 bases. For ChIP-seq analysis, clean reads were mapped to *P. falciparum* 3D7 reference genome (release 33, <http://plasmodb.org/plasmo/>) using Bowtie 2 (version 2.2.4), allowing 1 mismatch (parameters “-p 8 -N 1”) (4), and default settings for other parameters. The mapped reads with low mapping quality and putative PCR duplicates were filtered out with sam tools (v1.7) to obtain high quality and unique mapped reads (5). The sam files of mapping results were then converted into bam files. The bam files were sorted and indexed using samtools. To enable viewing the sequencing results in a genome browser, the genome-wide read coverage and enrichment were assessed using deepTools (tags were binned, smoothed, and RPKM normalized) (6). The signal profiles of all ChIP-seq assay (PfRecQ1 and PfWRN localization or H3K9me3 histone modification) were plotted using the in-house python scripts based on the metaseq

framework (7).

For RNA-seq analysis, clean reads were mapped to *P. falciparum* 3D7 reference genome (release 33, <http://plasmodb.org/plasmo/>) using HISAT2 with default parameters (8). We used featureCounts (v1.6.1) to count the number of reads mapping to the annotated genes (9). Counted reads were used to do differential expression analysis after normalized by TPM (Transcripts Per Million) method. The up-regulated genes ( $\log_2$  fold change  $> 1$ ) were then used to perform GO analysis. All scatter plots were plotted using the Matplotlib Python package (v2.2.2). The GO bar plot was made by seaborn Python package (v0.8.1).
