

Supplementary materials

Supplementary material 1. MATLAB code for calculating the extended Poincaré plot indices i.e. Pearson's correlation coefficient (r), SD1 and SD2. Let A be a matrix which corresponds to a physiological time-series such as inter-beat interval, inter-breath interval or body temperature. This script can be save as a MATLAB function (extpoinc.m). Inputs: A (time-series) and k (maximum lag). Outputs: Pearson's r (r), P-value for the correlation coefficient (P), SD1 and SD2.

```
function [r,P, SD1, SD2] = extpoinc(A,k) % MATLAB function  
for calculating the extended Poincaré plot indices.  
Inputs: A (a time-series) and k (maximum steps/lags in the  
extended Poincare' plot). Outputs: Pearson's r (r), P-  
value for the correlation coefficient (P), SD1 and SD2.  
  
n = size (A);  
r = NaN(k,1);  
P = NaN(k,1);  
SD1 = NaN(k,1);  
SD2 = NaN(k,1);  
  
for i=1:k  
  
    X = A(1:n-i);  
    Y = A(i+1:n);  
    [cc,p] = corrcoef(X,Y);  
    r (i,1) = cc(1,2);  
    P (i,1) = p(1,2);  
    SD1 (i,1)= std((X - Y)./sqrt(2));  
    SD2 (i,1)= std((X + Y)./sqrt(2));  
end
```

Supplementary material 2. Receiver operating characteristic (ROC) curves used to evaluate the diagnostic capability of the extended Poincaré plot indices to differentiate between atopic and non-atopic asthma as well as controlled and uncontrolled asthma. (a) Pearson's correlation coefficient, r. (b) SD1 (c) SD2. (*optimal steps for disease classification)

(a)	Atopic vs non-atopic asthma			Controlled vs uncontrolled asthma
