

Figure S6. Galunisertib or anti-PD-1 monotherapy fails to significantly improve survival in KPC mice

Pdx1-Cre x LSL-KRAS^{G12D} x TP53^{R172H} (KPC) mice were generated and treated as described. Survival was plotted by the Kaplan-Meier method, indicating no significant difference between Control, Galunisertib, or anti-PD-1 treated mice (N=4-9/group).
