**Supplementary Figure S1. Principal Component Analysis (PCA) on whole-transcriptome profiles of 27 strains employed in this study.** The plot depicts a principal component analysis of the transcriptomes of uninjured hearts across 27 selected RI CC strains. The first principal component (PC1) explains 5.37% of the observed variation across strains while the second principal component (PC2) explains 4.85% of the variation. LVSD/HF resilient strains are highlighted in green, while LVSD/HF susceptible strains are highlighted in red.

**Supplementary Figure S3. Expression levels of *Cep128* (a), *Myo18b* (b) and *Tnni3k* (c) genes in selected CC strains determined by RT-qPCR.**

Strains are ordered according to the quantitative expressivity of the trait: LV dilation for *Myo18b* and *Tnni3k*, and survival rate (occurrence of myocardial rupture) for *Cep128*. Expression levels are normalised against *Gapdh* and presented as fold expression change relative to expression in B6 strain, considered as 1. Data is presented as mean value  $\pm$  SD of 2-5 biological replicates.
