**Tab. 1** Computed hemodynamic and geometric parameters.

	<b>Variable</b>	<b>Definition</b>
Hemodynamics	ICI	Inflow concentration index
	Q [cm <sup>3</sup> /s]	Mean inflow rate into aneurysm
	KE [erg]	Mean kinetic energy
	SR [1/s]	Mean shear rate
	VE [cm/s]	Mean velocity
	VO [1/s]	Mean vorticity
	VD [erg/s]	Mean viscous dissipation
	WSSmax [dyne/cm <sup>2</sup> ]	Maximum wall shear stress
	WSSmin [dyne/cm <sup>2</sup> ]	Minimum wall shear stress
	WSSmean [dyne/cm <sup>2</sup> ]	Mean wall shear stress
	LSA (%)	Low shear area
	SCI	Shear concentration index
	OSI <sub>max</sub>	Maximum oscillatory shear index
	OSI <sub>mean</sub>	Mean oscillatory shear index
	WSSves [dyne/cm <sup>2</sup> ]	Mean wall shear stress in parent vessel
	WSSnorm	Normalized WSS = WSSmean/WSSves
	MWSSnorm	Maximum normalized WSS = WSSmax/WSSves
Morphology	Corelen [cm]	Vortex core line length (flow complexity)
	podent	Proper orthogonal decomposition (POD) entropy (flow stability)
	Vmax [cm/s]	Peak velocity
Morphology	Avol [cm <sup>3</sup> ]	Aneurysm volume
	Asize [cm]	Max. distance between any two points on the aneurysm surface
	Nsize [cm]	Max. distance between any two points on the neck surface
	Narea [cm <sup>2</sup> ]	Area of the neck surface
	AR	Aspect ratio = aneurysm depth/neck diameter
	Aheight [cm]	Max. normal distance of all points on dome from aneurysm neck

	Awidth [cm]	Max. diameter of aneurysm slices parallel to aneurysm neck
	HWR	Height to width ratio = aneurysm height/ aneurysm width
	BF	Bottle neck factor = aneurysm width/neck diameter
	BL	Bulge location = Distance of plane with largest diameter from neck / height
	Vdiam [cm]	Vessel diameter: Diameter of nearest vessel from aneurysm neck
	SizeR	Size ratio = Aneurysm size/Vessel diameter
	VOR	Volume to ostium ratio = Aneurysm volume/Area 2D of neck
	CR	Convexity ratio = Aneurysm volume/Volume of convex hull
	EI	Ellipticity index = $1-(18\pi)^{1/3} (V^{2/3}/ S)$ , with V and S referring to the volume and area of the aneurysm convex hull, respectively
	NSI	Non-sphericity index = $1-(18\pi)^{1/3} (V^{2/3}/ S)$ , with V and S referring to the aneurysm volume and area, respectively
	MLN	L2-Norm of mean curvature

**Tab. 2** Results of the univariate comparison of ruptured (R) and unruptured (U) aneurysms from all aneurysm locations combined. The p-value refers to the Wald test, the coefficient to the coefficient of the fitted univariate logistic regression model

**Tab. 10** Results of the univariate comparison of sidewall (S) and bifurcation (B) MCA aneurysms (left) and PCOM aneurysms (right). The p-value refers to the Wald test, the coefficient to the coefficient of the fitted univariate logistic regression model
