

Legend: Left column: comparison to age matched healthy controls (median of patients) Right column: frequency of abnormal finding among patients with the same PID

■ values below - 5 SD ■ values - 2 SD to - 5 SD ■ normal values ■ values 2 SD to 5 SD ■ values greater than 5 SD
■ 50% - 75% ■ over 75% (for a disease group with 3 or more cases)

Figure S2. Discriminative power of the PIDOT. List of the 36 parameters determined with the EuroFlow screening tube. In the left columns the distance in number of standard deviation (SD) from controls of the same age group as the patient are given per parameter, followed by a scoring ranging from extremely high (>5SD) to high (>2SD), low (<-2SD) or extremely low (<-2SD). In the right column the frequency of abnormal findings among patients with the same PID are displayed for a category of > 3 cases per group in light grey (50-75%) and dark grey (>75%). The number of abnormal parameter per disease group was scored.
