68 **Figure S1. Structural motifs predicted in proteins of the MLS10 Srr operon *srrEABCF***
69 **(Bsel 1475 – Bsel_1480).** The annotation is that provided by the Joint Genome Institute
70 Integrated Genome who sequenced the genome. A) SrrE, Rhodanese domain protein. The
71 putative lipoprotein motif anchoring the protein to the membrane is highlighted in grey. The
72 putative rhodanese domains are highlighted in purple. One rhodanese domain has a predicted
73 catalytically active cysteine residue, highlighted in teal. B) SrrA, Trimethylamine-N-oxide
74 reductase. The putative twin arginine translocation motif is highlighted in teal. The putative
75 4Fe-4S cluster is highlighted in yellow. The cysteine residue predicted to coordinate the guanine
76 dinucleotide molybdopterin cofactor is highlighted in red. C) SrrB, 4Fe-4S ferredoxin iron-sulfur
77 binding domain protein. The four predicted 4Fe-4S iron clusters are highlighted. The first 4Fe-
78 4S cluster is highlighted in red. The second 4Fe-4S cluster is highlighted in purple. The third
79 4Fe-4S cluster is highlighted in teal. The fourth 4Fe-4S cluster is highlighted in yellow.
80 D) SrrC, Polysulfide reductase NrfD. E) SrrD, Chaperon protein NarJ. F). SrrF, Rhodanese
81 domain protein. The putative lipoprotein motif anchoring the protein to the membrane is
82 highlighted in grey. The putative rhodanese domains are highlighted in purple. All three
83 rhodanese domains have predicted catalytically active cysteine residues, highlighted in teal.
