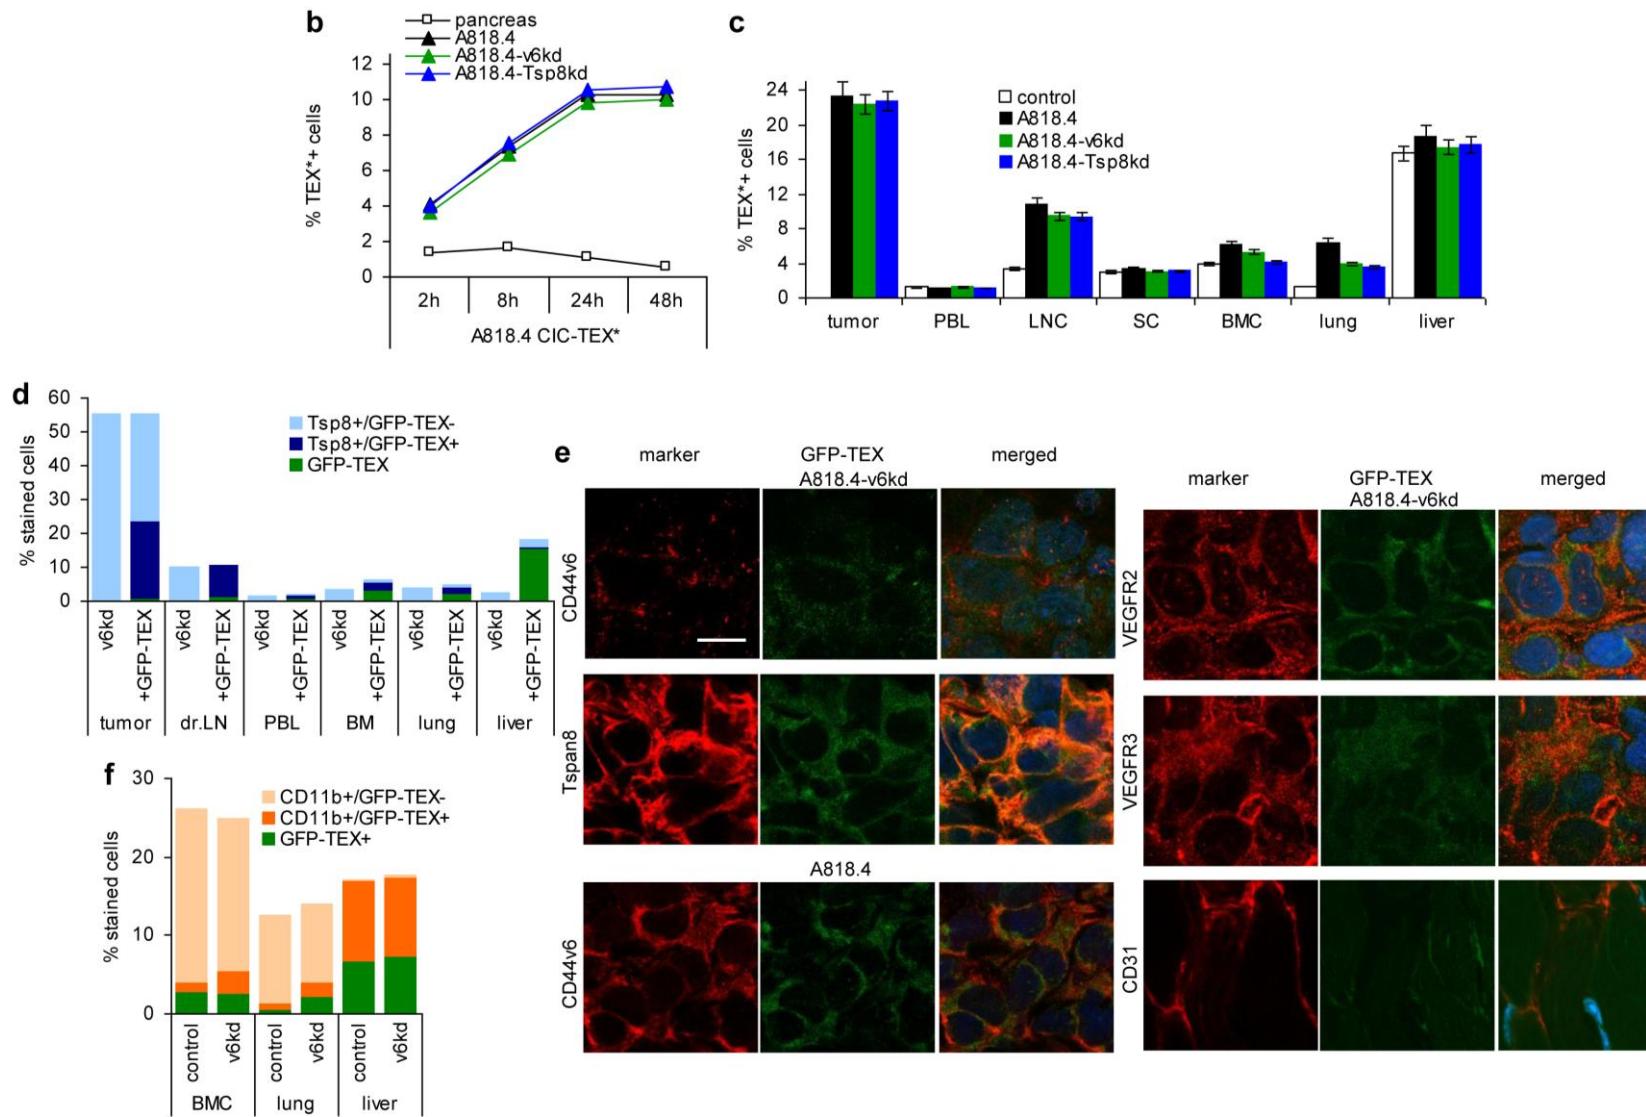

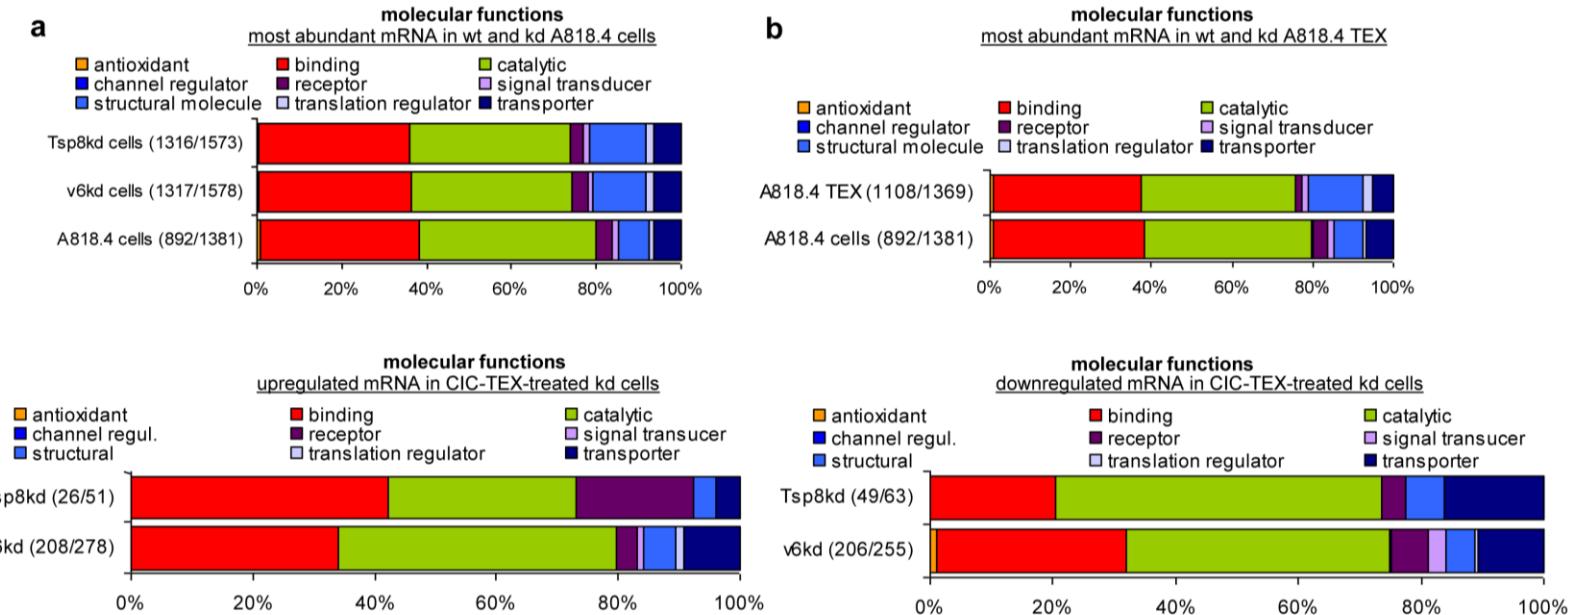

Figure S1 TEX characterization and in vivo distribution of CIC-TEX. (a) Flow-cytometry of A818.4, -v6kd and -Tsp8kd cells and LB-coated TEX were stained for the indicated CIC-markers and prominent Exo markers. The mean % \pm SD of 3 assays are shown; significant differences between wt, v6kd and Tsp8kd cells and TEX: *. (b-e) CIC-TEX were Dio-labeled or derived from GFP-transfected A818.4 cells. (b,c) Mice bearing intrapancreatic tumors received a single iv injection of Dio labeled TEX. (b) Uptake in the pancreas, A818.4, -v6kd and Tsp8kd tumors was evaluated by flow-cytometry after 2h-48h and (c) in the indicated organs 24h after TEX application; the mean % Dio-labeled cells \pm SD (3 mice/group) is shown. (d-f) Nude mice received a sc injection of tumor cells and weekly iv injections of CIC-TEX derived from GFP-transfected A818.4 cells (GFP-TEX). Mice were sacrificed, when the tumor reached a mean diameter of 0.5cm. (d,f) Flow-cytometry analysis of dispersed cells from the tumor and metastasis-prone organs stained with anti-GFP-FITC and anti-Tsp8-APC or anti-CD11b-APC; the mean % (3 mice/group) of single and double stained cells is shown; (e) confocal microscopy of shock-frozen tumor sections counterstained with the indicated antibody and Cy3-labeled secondary antibodies and DAPI; representative examples are shown; scale bar: 10 μ m.

As described, a v6kd affects Tsp8 and MET expression, a Tsp8kd has a minor impact on v6 and CD104 expression. With the exception of slightly reduced CD63 expression in v6kd TEX, the v6kd and the Tsp8kd do not affect TEX marker expression. TEX are preferentially taken up by the tumor and in the liver. In the tumor, draining LN, lung and PB mostly tumor cells take-up TEX; in the BM and most pronounced in the liver CIC-TEX are also taken-up by M \square . There was no difference in the uptake between wt and v6kd or Tsp8kd cells.

Figure S2 Differences in the mRNA profile of A818.4, -CD44v6kd and -Tspan8kd cells and TEX and the impact of CIC-TEX on CD44v6kd and Tspan8kd cells. (a-c) mRNA of A818.4, -v6kd and -Tsp8kd cells and TEX and of CIC-TEX-treated (72h) v6kd and Tsp8kd cells were analyzed by DS. After normalization data were evaluated (a,b) for molecular functions of most abundant (signal strength ≥ 5000) mRNA in wt versus kd cells and wt cells versus TEX, (c) mRNA (signal strength ≥ 1000) ≥ 2 -fold up- or downregulated by CIC-TEX coculture of kd cells. (d,e) Combined Panther pathway and Reactome analysis of mRNA (signal strength ≥ 1000) that differed ≥ 2 -fold between kd cells and CIC-TEX-treated kd cells according to the indicated groups (differences in Tsp8kd cells: blue, in v6kd cells: violet; genes that are repeatedly mentioned in distinct groups are underlined) (List of synonyms: Table S1).

TEX coculture-induced differences in the mRNA profile are more frequent in v6kd than Tsp8kd cells; genes engaged in transcription/translation, transport and signaling are most abundantly affected.

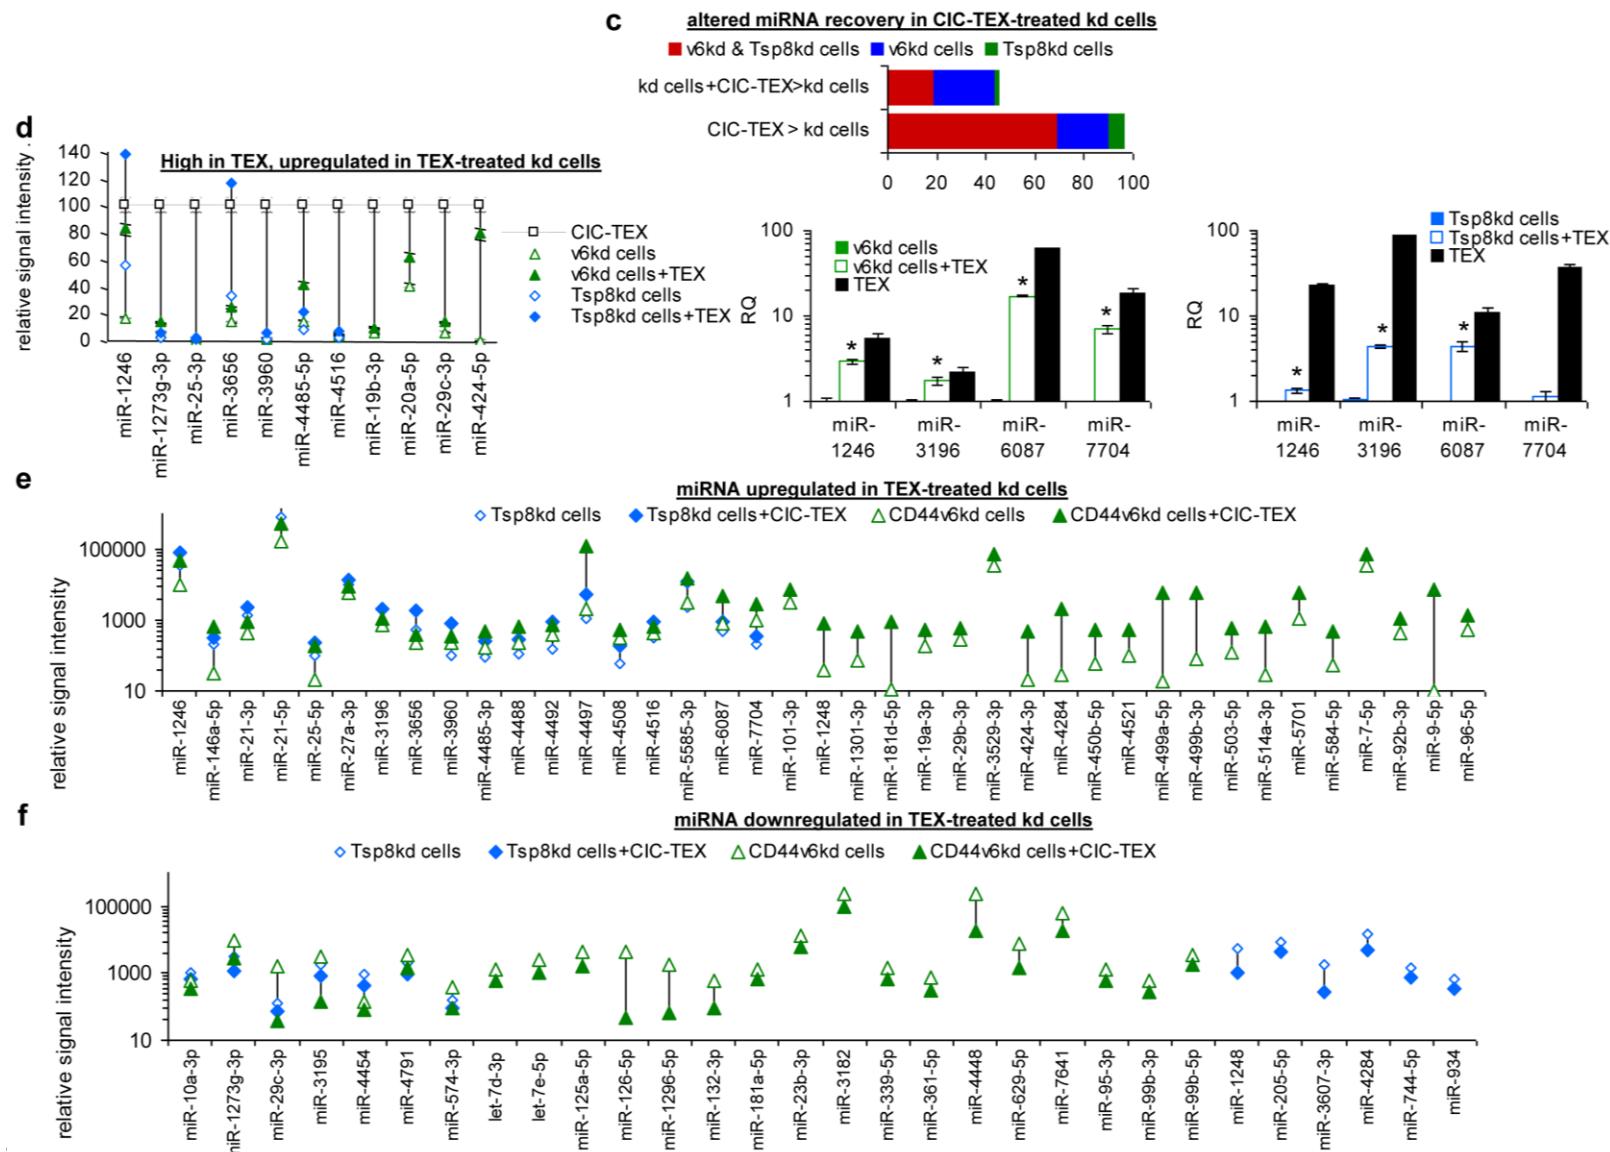

Figure S3 Distinct miRNA recovery in wt-TEX versus CD44v6kd and Tspan8kd TEX and in kd cells cocultured with CIC-TEX. (a,b) Recovery of miRNA (signal strength in wt TEX ≥ 1000) that expression is ≥ 2 -fold reduced in v6kd and/or Tsp8kd TEX. (c-f) miRNA of CIC-TEX, v6kd and Tsp8kd cells and kd cells cocultured with CIC-TEX was evaluated by DS. After normalization miRNA with a signal strength ≥ 500 were analyzed for (c) significant differences (≥ 1.5 -fold) in the signal strength between CIC-TEX and kd cells and between kd cells versus CIC-TEX-treated kd cells; (d) miRNA recovered at an ≥ 1.5 -fold lower level in kd cells than CIC-TEX (values normalized to 100) and being ≥ 1.5 -fold increased after coculture with CIC-TEX, which was confirmed by qRT-PCR for selected examples, showing RQ values for kd cells, CIC-TEX-treated kd cells and CIC-TEX; RQ values \pm SD (triplicates) are shown, significant increase in kd cells by coculture with CIC-TEX: *, (e,f) ≥ 1.5 -fold increased or decreased miRNA recovery in CIC-TEX-treated v6kd and/or Tsp8kd cells compared to untreated kd cells (independent of the signal strength in CIC-TEX).

The miRNA profile of wt TEX differs from that of kd, particularly v6kd TEX, most prominent being the loss in let7 miRNA in v6kd TEX. CIC-TEX miRNA also strongly differs from that of kd cells. Coculture with CIC-TEX alters the miRNA profile of the kd, mostly v6kd cells. However, despite recovery of CIC-TEX miRNA in kd cells, coculture-induced changes rarely are related to the CIC-TEX miRNA content.

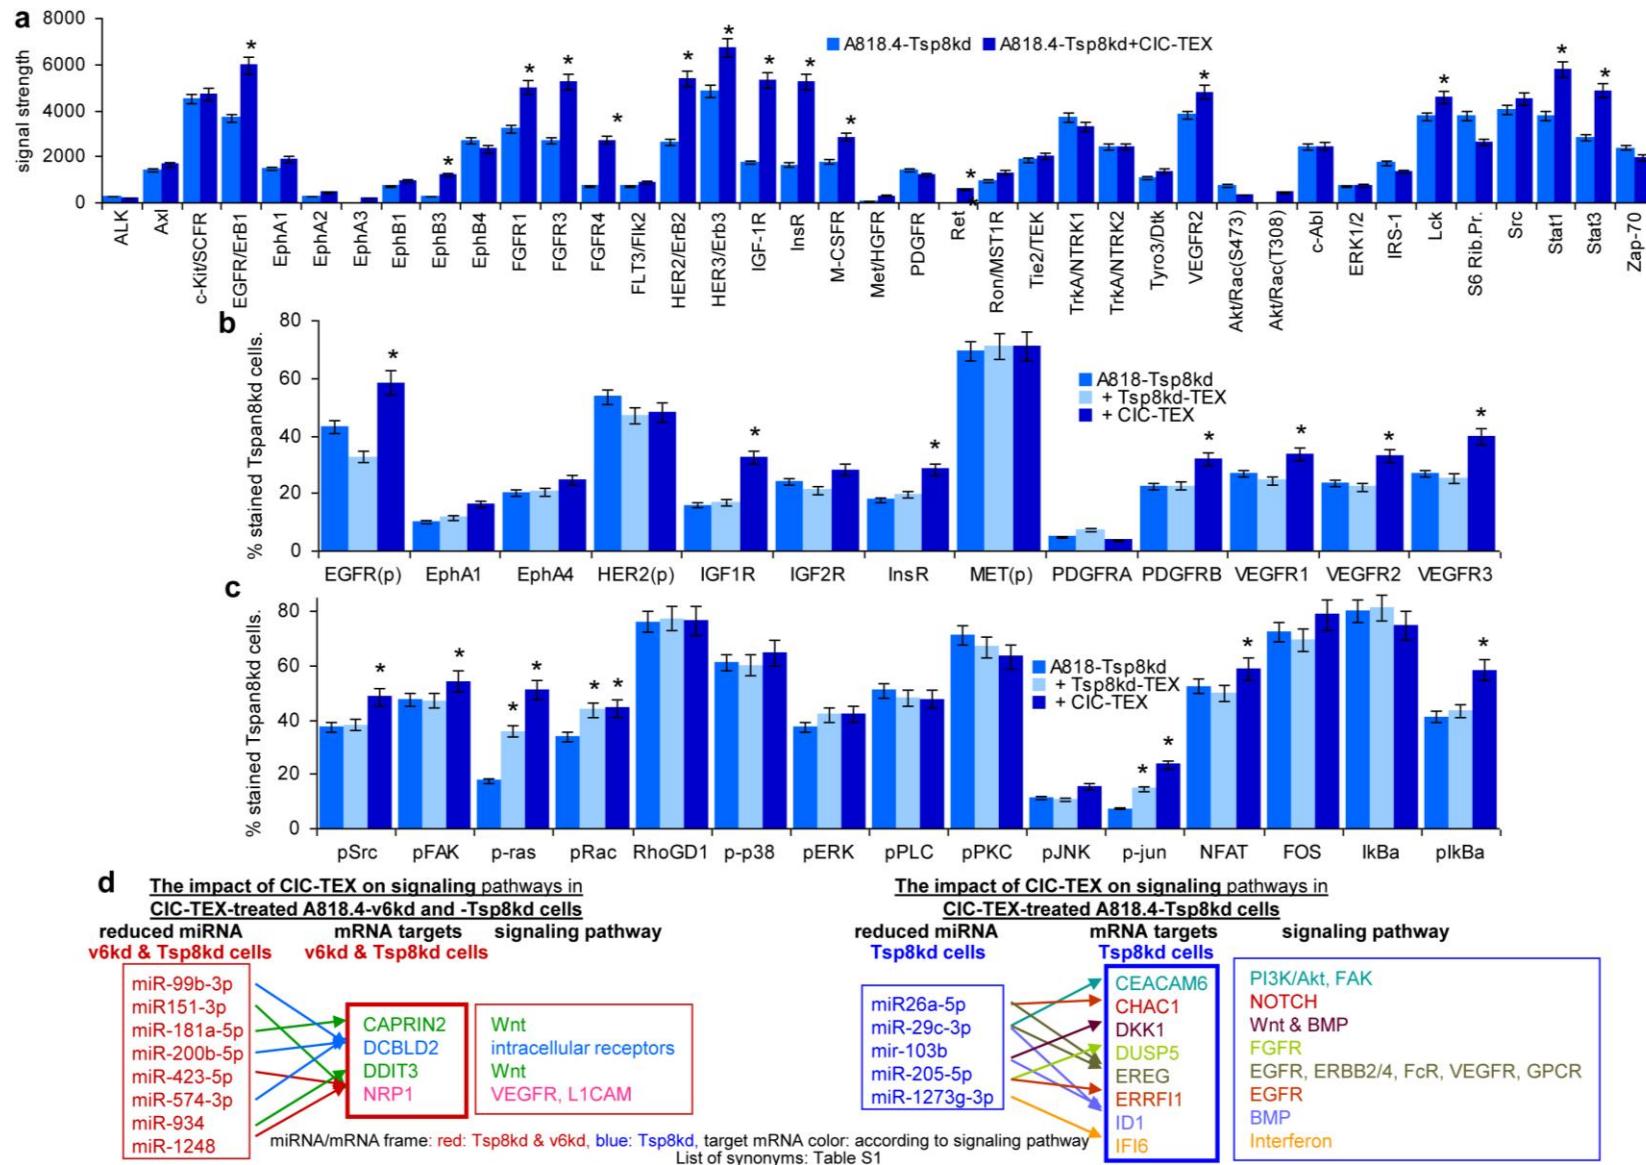

Figure S4 CIC-TEX-initiated changes in RTK and downstream signaling molecules in Tspan8kd cells and mRNA release from repression by reduced miRNA expression in CD44v6kd and/or Tsp8kd cells. (a) Signaling array of A818.4-Tsp8kd cells cultured for 72h with/without CIC-TEX. The relative signal strength was evaluated by ImageJ; significant differences by coculture with CIC-TEX: *. Flow-cytometry of (b) RTK expression and (c) major pathway-engaged cytosolic signaling molecules in Tsp8kd cells and Tsp8kd-TEX- or CIC-TEX-treated Tsp8kd cells; (b,c) mean % stained cells \pm SD (3 assays), significant differences by coculture with TEX: *; (d) IPA-based STRING analysis after predicted target mRNA selection by [microrna.org](#) and [targetscan.org](#) for ≥ 2 -fold reduced miRNA in CIC-TEX-treated compared to untreated v6kd and/or Tsp8kd cells and of ≥ 2 -fold upregulated predicted mRNA targets, that are engaged in signal transduction. (List of synonyms: Table S1).

The signaling array and flow-cytometry analysis of TEX-treated Tsp8ko cells confirms the striking impact of CIC-TEX on promoting signaling cascade activation. The analysis of inversely correlating miRNA and predicted mRNA in CIC-TEX-treated v6kd and/or Tsp8kd cells backs the potential engagement of regulated miRNA expression on mRNA recovery.

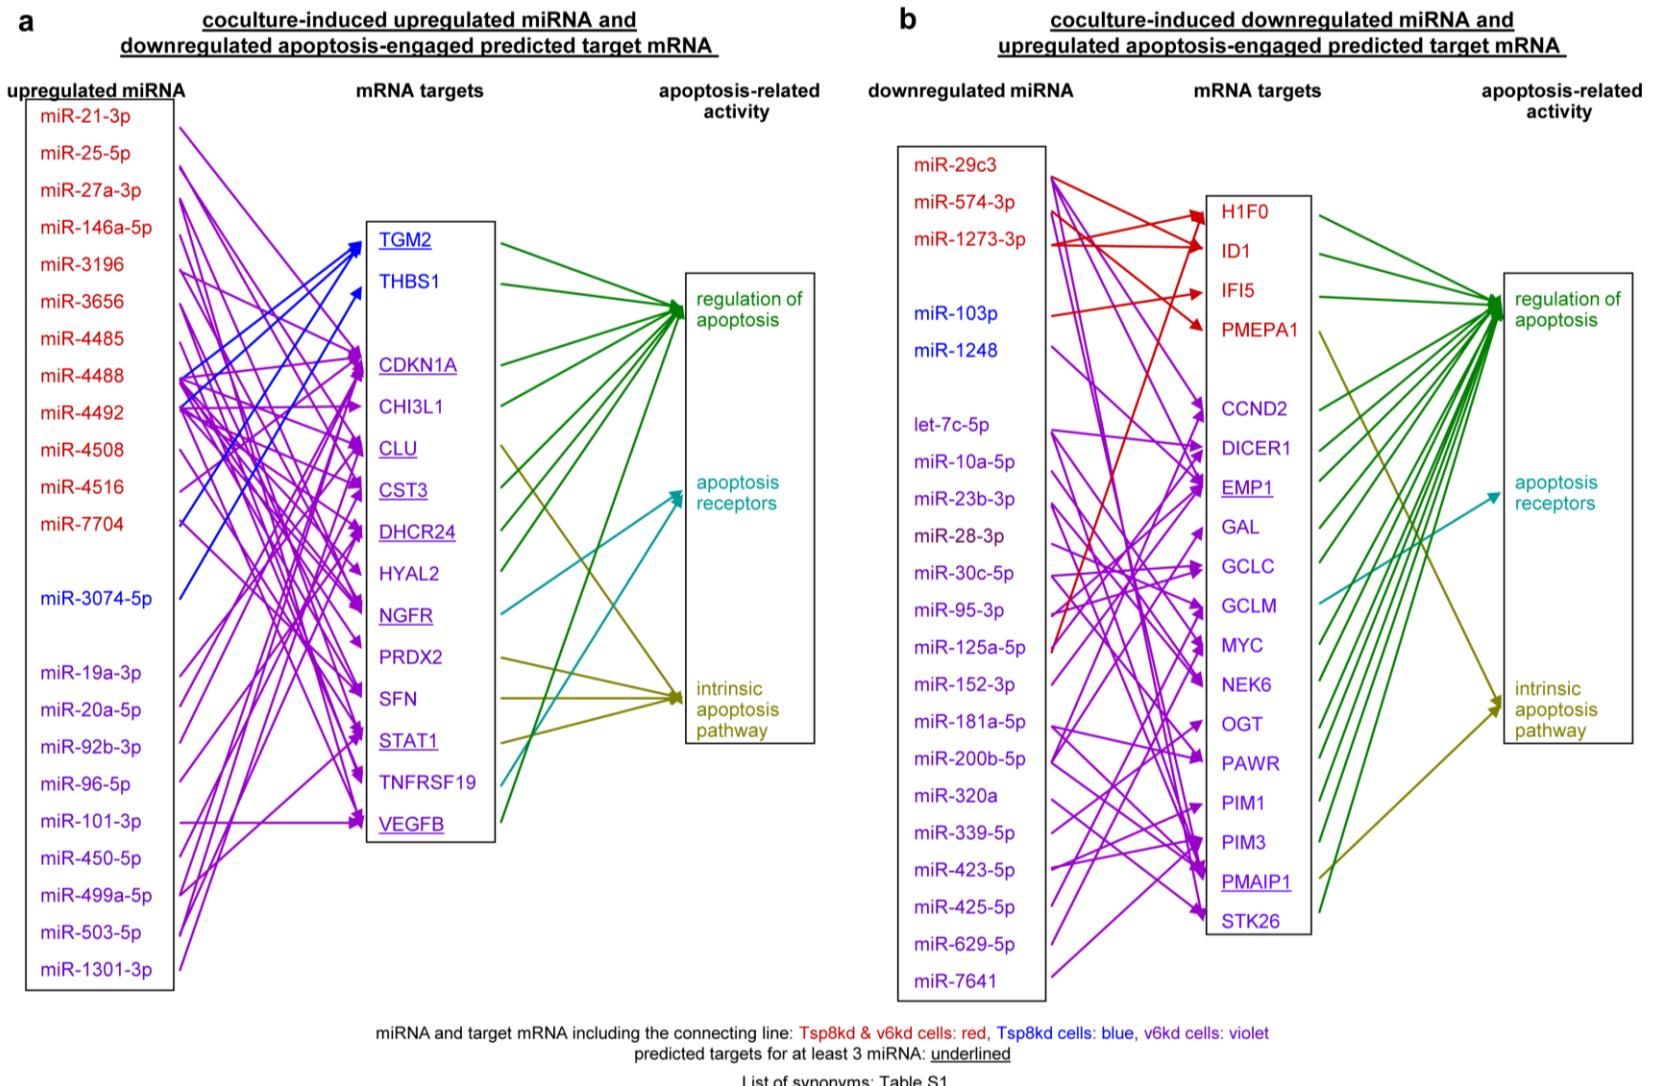

Figure S5 CIC-TEX-promoted changed miRNA recovery and predicted target mRNA engaged in apoptosis. List of miRNA that expression was ≥ 2 -fold higher (a) or lower (b) in CIC-TEX treated than untreated v6kd and/or Tspan8kd cells (v6kd and Tsp8kd cells: red, Tsp8kd cells: blue, v6kd cells: violet). After selection of predicted target mRNA by [microrna.org](#) and [targetscan.org](#) that expression was inversely to miRNA ≥ 2 -fold altered after CIC-TEX coculture, mRNA engagement in apoptosis-related processes was evaluated by IPA-based STRING analysis. (List of synonyms: Table S1). CIC-TEX coculture-promoted changes in apoptosis-related miRNA are most pronounced in v6kd cells. This also accounts for predicted target mRNA that expression inversely correlated with miRNA up- or downregulation. Predicted target mRNA mostly is engaged in regulation of apoptosis. In addition, several predicted mRNA are only targets for 1 or 2 miRNA.
