Supplementary Material "A re-annotation of the Anopheles darlingi mobilome"

List S1 - Description of 36 "full length" transposable elements found in the *Anopheles darlingi* genome.

The "full length" elements or elements large enough to deserve a detailed analysis were separated; 36 are described below.

Abbreviations

bp – base pairs

Kb – kilo base pairs (1000 nucleotides)

TIR – Terminal inverted repeat

TSD – Target sequence duplication

ORF – Open Reading frame

1 – Mariner1-Andl

Degenerated element

Short description

A total of 190 copies of this element were found in the *An. darling* genome, the larger showing 907 bp. TIRs were not found. TSD containing TA sequence were observed. The ORF finder found 8 ORFs, indicating this element is not able to produce active enzymes. Only Orf 8 has a significant hit with transposase.

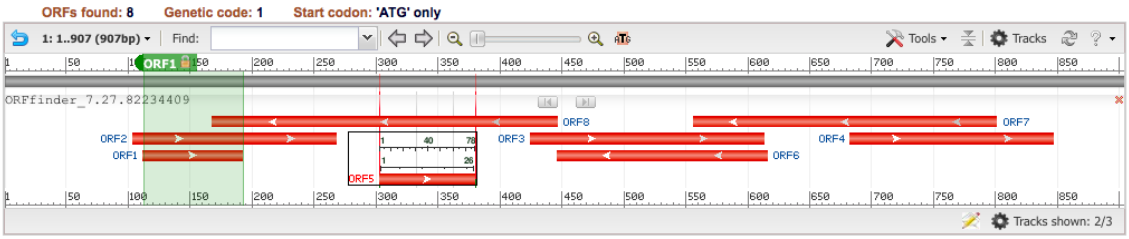

Figure 1- Orf Finder scheme for ORFs detected in the ***Mariner1-Andl*** element

2 Mariner2-Andl

Degenerated element

Short description

A total of 32 copies of this element were found in the *An. darling* genome, the larger showing 941 bp. TIRs were not found but TSD consisting TA nucleotide were observed. The ORF finder found 7 short ORFs, indicating this element is not able to produce active enzymes.

3 – Mariner3-Andl

Degenerated element

Short description

A total of 28 copies of this element were found in the *An. darling* genome, the larger showing 1265 bp. TIRs were not found but TSD consisting TA nucleotide were observed. The ORF finder found 14 short ORFs, indicating this element is not able to produce active enzymes.

4 – Mariner4-Andl

Truncated element

Short description

A total of 44 copies of this element were found in the *An. darling* genome, the larger showing 1194 bp. TIRs were not found. However, TSDs consisting of TA were observed. The ORF finder found 9 ORFs.

8 – Mariner8-Andl

Truncated element

Short description

A total of 20 copies of this element were found in *An. darling* genome, the larger showing 1675 bp. TIR were not found by TSD consisting TA were observed. The ORF finder found 8 ORFs, indicating this element is not able to produce active enzymes. However, two large ORFs (148 and 141 aa) showed hits with transposase, indicating this element became degenerated recently.

9 – Mariner9-Andl

MITE

Short description

A total of 10 copies of this element were found in *An. darling* genome, the larger showing 738 bp. The TIRs have 223 pb and TSD consisting TA. The ORF finder found 9 ORFs, indicating this element is not able to produce active enzymes. These characteristics suggest that such sequences are MITEs.

10 – Mariner10-Andl

MITE

Short description

A total of 2 copies of this element were found in *An. darling* genome, the larger showing 489 bp. The TIRs have 22 pb and TSD consisting TA. The ORF finder found only 1 ORFs. However, this ORF is very short (22 aa) indicating this element is not able to produce active enzymes. These characteristics suggest that such sequences are MITEs.

ORF 1 -no significant hit

11 – Mariner11-Andl

Potentially active element (at least recently)

Short description

A total of 12 copies of this element were found in *An. darling* genome, the larger showing 1285 bp. The element has TIR 230pb long and TSD consisting TA nucleotides. The ORF finder found 12 ORFs. However, two larger ORFs (ORF 3 and 1) codify a transposase with 301 aa, compatible with an active transposase. The assembled copies showed a frameshift, but it is possible there are functional copies in the populations.

26 – Mariner26-Andl

MITE

Short description

A total of 21 copies of this element were found in *An. darling* genome, the larger showing 702 bp. TIR are 28 pb long and TSD consisting TA nucleotides. The ORF finder found 3

short ORFs, indicating this element is not able to produce active enzymes. The short length, conserved TIR and TSD suggest this element can be a MITE.

35 Gypsy2_Andl

Putatively active element

The sequence shows a full-length element with LTR having 167 pb, CDS from nucleotide 244 to 4111. However, the CDS are divided in three, which can be due to translational frameshifts that occurs in many retrotransposons. Also, the available sequence is not complete and the NNNs observed in the sequence could explain the first frameshift.

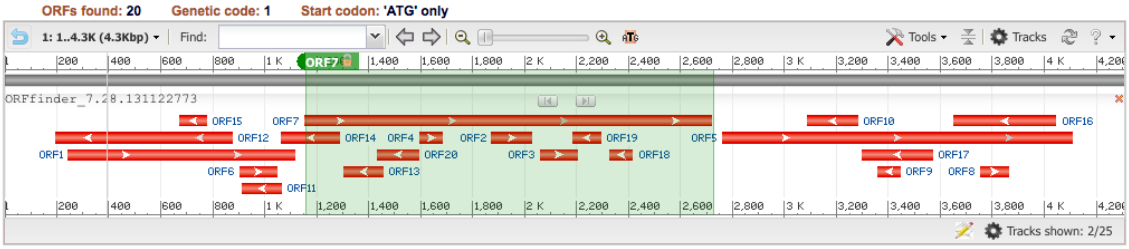

Figure 35 - Orf Finder scheme of ORFs detected in the Gypsy2_Andl element

CDS

Label	Strand	Frame	Start	Stop	Nt	aa
ORF 1	+	1	244	1119	876	291
ORF7	+	3	1152	2723	1572	523
ORF5	+	2	2762	4111	1350	449

36 - Copia1_Andl

Putatively active element

The element has 4291 bp and LTRs with 184 bp. The ORF expand from nt 213..3941, coding a polyprotein with 1243 aa.
