

Figure S11A. Expression pattern of NK cell markers as a function of gestational age in fetal liver and spleen NK cells. Maturation markers CXCR6, CD16, CD57, and KIR2DL1-DS1 were analyzed. Percent positive of total NK cells is shown. Fetal liver NK (blue); fetal spleen NK (green). Gestational ages ranged from 17 to 23 weeks. $n = 1 - 3$. All data points are shown.

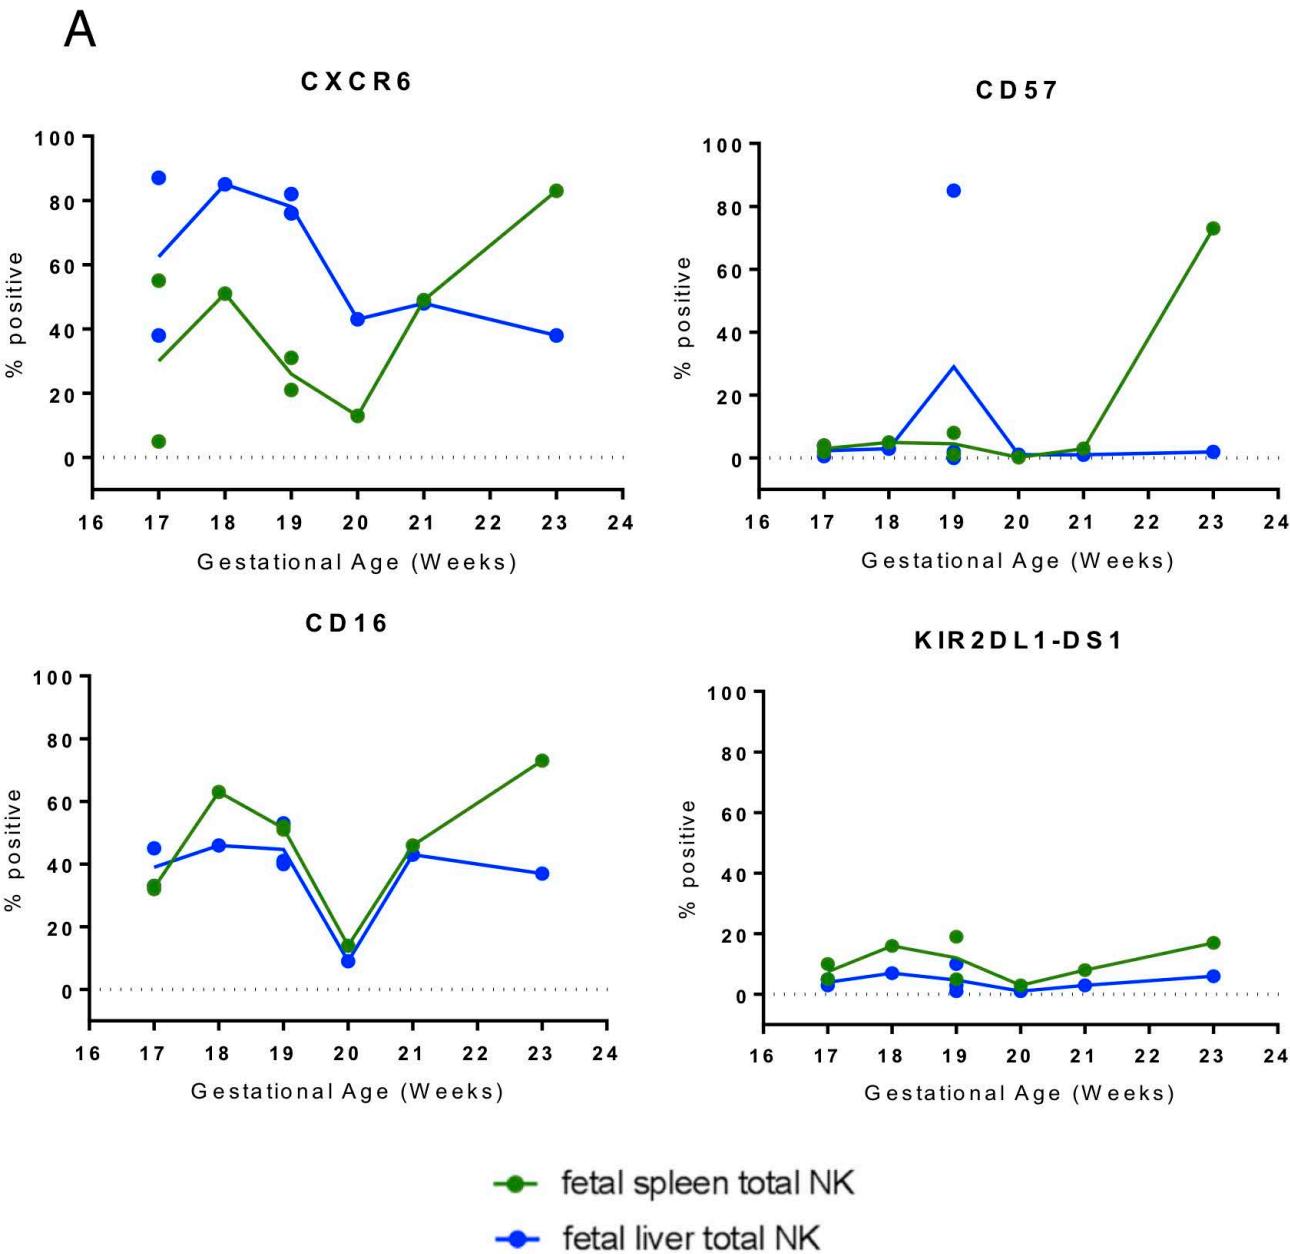

Figure S11B. Comparison of NKG2A, NKG2D, CD94, and natural cytotoxicity receptor NKp46 in total fetal liver and spleen NK cells as a function of gestational age.

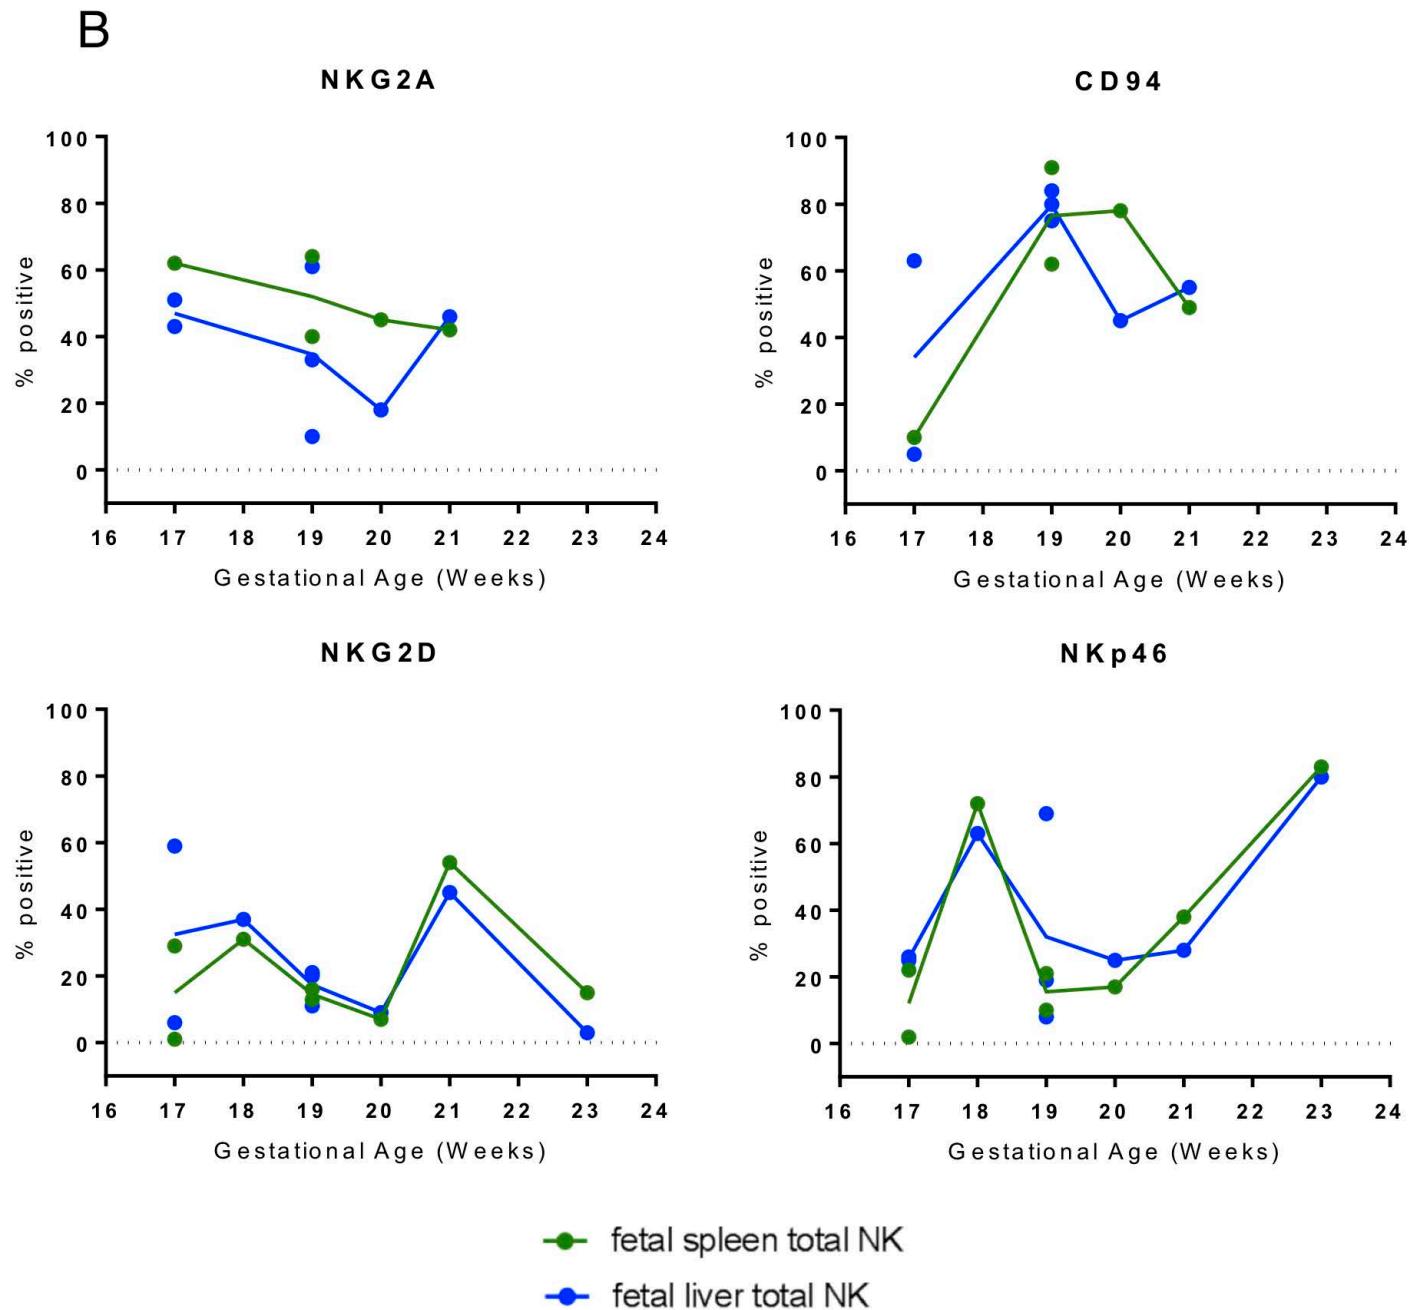

Figure S11C. Tissue-specific (CD49e, CD69), and migration/homing receptors (CD62L, CX3CR1) as a function of gestational age in fetal liver and spleen NK cells.
