Notes: Each column is from a separate regression. The sample size for each regression is 158,306. Coefficients (marginal effects calculated at the mean of covariates) and cluster-robust standard errors (in parenthesis) are reported in cells. The coefficients represent the per person difference in the dependent variable between less favorable CVH strata and all favorable strata. All regressions also control for age at follow-up, state of residence, year, baseline age, race, sex, baseline education, and whether the participant died during the year. \*\* p<0.05; \*\*\* p<0.01
