

**S3 Fig. Differences in gene expression in normal epithelial cells in human prostate tissue between genistein treated and control subjects.** Gene expression was measured in normal prostate epithelial cells from N = 14 genistein treated and N = 14 control subjects, as in S1 Fig. Data are the mean  $\pm$  SEM of expression for each gene measured on the array. Lines denote 1.8 fold differences from the line of unity. Outlier genes, as defined in Methods, are denoted.
