

Figure S2. Growth phenotypes of the wild-type, $\Delta mpkA$, $\Delta mpkB$ and corresponding complementing mutants grown in MM in presence of (A) *t*-Butyl, (B) menadione, (C) paraquat, and (D) hydrogen peroxide. The strains were grown for 48 hours at 37 °C either on solid AMM media (A-C) or on AMM liquid media in 96-wells plates (D). Numbers of inoculated conidia are also reported.
