## eMethods. Further Methods

### Eligibility criteria

Additional inclusion criteria included disease progression during or after anti-estrogen therapy or relapse after adjuvant anti-estrogen therapy; at least one measurable or non-measurable lesion per Response Evaluation Criteria In Solid Tumors (RECIST) v1.0; and an Eastern Cooperative Oncology Group performance status  $\leq 2$ . Exclusion criteria included clinical manifestations of diabetes mellitus (fasting glucose  $\geq 140$  mg/dL [7.8 mmol/L]); history of gestational or documented steroid-induced diabetes mellitus; brain metastasis, unless treated and asymptomatic without corticosteroid therapy; prior treatment with a PI3K, AKT, or mTOR inhibitor without clinical benefit; impaired cardiac function, clinically significant cardiac disease, or concurrent medication with known risk of QT prolongation or torsades de pointes.

### Alpelisib administration

Patients were instructed to take their daily dose of alpelisib at approximately the same time each morning. For days when blood collection was scheduled at the clinic, patients took their daily dose at the clinic.

Patients took alpelisib one hour after a light breakfast (e.g. consisting of juice, toast, and jam) and continued fasting for 1 hour after each dose. If the patient forgot to take their daily dose of alpelisib by 12 noon, then the dose was withheld that day. If, for any reason, breakfast was missed, then the daily dose of alpelisib was taken with a glass of water at the scheduled time.

Patients undergoing a dose reduction initiated treatment at the preceding dose level in the dose escalation part of the study. In the dose expansion part, dose reductions could be by 25% or to the next lower dose level, according to investigator judgement. Only two dose reductions per patient were permitted. For example, patients could dose-reduce alpelisib from 400mg to 300mg to 200mg, or patients starting at 300mg or 350mg could dose-reduce to 200mg based on investigator judgement.

A maximum of two alpelisib dose reductions were permitted, after which the patient was discontinued if the treatment was still not tolerated. In addition, a patient had to permanently discontinue treatment if the same toxicity recurred at the same or greater severity after treatment is resumed at a lower dose. For each patient, once a dose level reduction had occurred, the dose level could not be re-escalated during subsequent treatment cycles except for the second occurrence of grade 1 or grade 2 hyperglycemia.

### Routine laboratory assessments

Routine laboratory assessments were conducted at baseline; weekly until Cycle 2, Day 28; and at 2-week intervals thereafter. A reduced assessment schedule was used for patients who completed 6 cycles of study treatment, in which Day 15 visits (vital signs, hematology, biochemistry, and fasting plasma glucose) were no longer required. However, these visits may have continued at the discretion of the Investigator. Other safety assessments, included glucose and cardiovascular monitoring. AEs were graded using Common Terminology Criteria for Adverse Events (CTCAE) v4.0. Tumor assessments were conducted using CT or MRI per RECIST v1.0 at baseline, end of Cycle 2, then every 8 weeks.

### Pharmacokinetic and pharmacodynamic profiling

Blood samples for pharmacokinetics and pharmacodynamics assessments were collected pre- and post-dose. For alpelisib QD, blood samples for full PK profiling were collected during Cycle 1 on Days 1 and 8, and during Cycle 2 on Day 1 at pre-dose and at 0.5, 1, 1.5, 2, 3, 4, 6, 8, and 24 h post-dose. In subsequent cycles, samples were collected on Day 1 at pre-dose.

Fasting serum insulin, fasting serum C-peptide and fasting plasma glucose for insulin and glucose safety monitoring were assessed pre-dose prior to the light breakfast at the following time-points: screening/baseline; pre-dose on Days 1, 8 and 15 of Cycle 1; pre-dose on Days 1 and 15 of Cycle 2; pre-dose on Days 1 and 15 of each cycle from Cycle 3 onwards; and of study treatment. Patients must have fasted overnight for at least 8 h.

Plasma concentrations of alpelisib were determined using a validated bioanalytical method with a lower limit of quantification of 1 ng/mL.

#### **Next-generation sequencing**

Tumor DNA was extracted from fresh, frozen or formalin-fixed, paraffin-embedded blocks or sections of tumor tissue. Comprehensive cancer genomic profiling was performed using the FoundationOne Assay (Foundation Medicine, Inc., Cambridge, MA, USA). The assay laboratory procedures (preparation of tumor DNA, library construction, and hybrid capture) and computational methods involved in subsequent data analysis have been described previously: Frampton *et al.* Development and validation of a clinical cancer genomic profiling test based on massively parallel DNA sequencing. *Nature Biotechnology* 2013;31:1023–31.

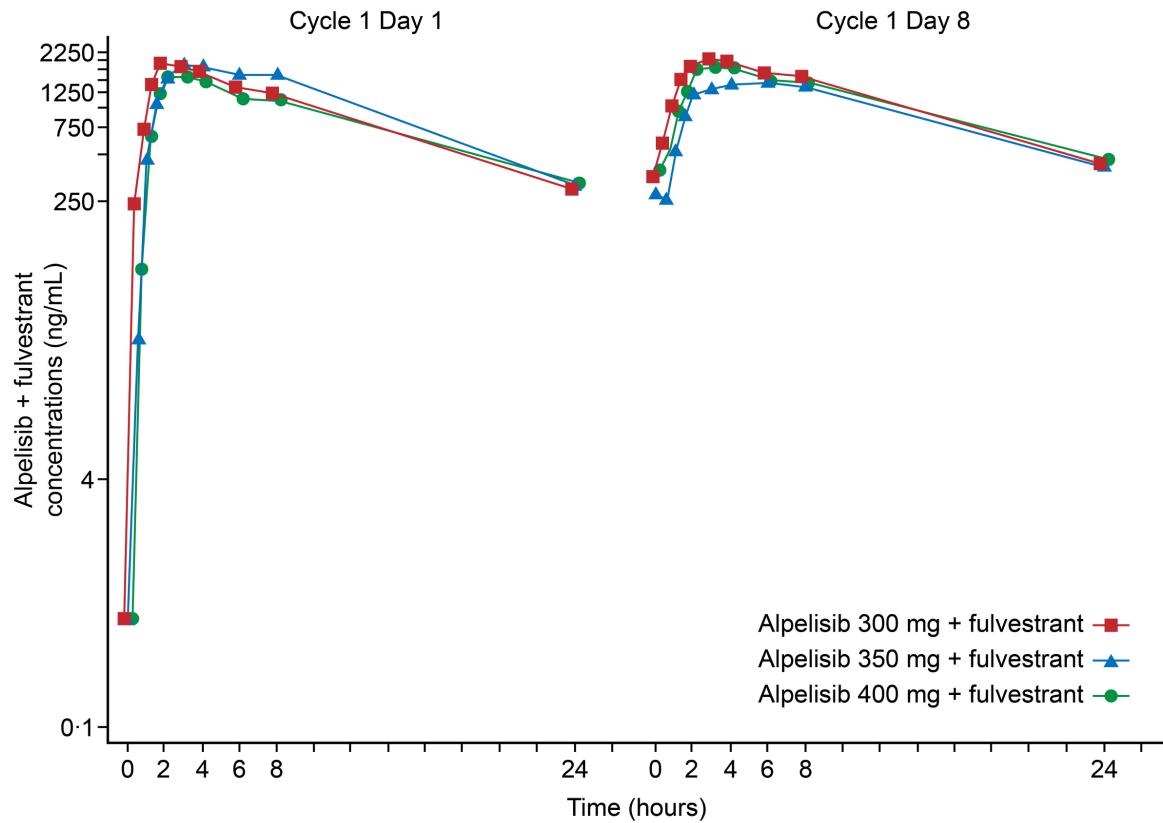

#### **Statistical analysis**

Dose-determining set comprised all patients in the safety set who experienced a DLT in Cycle 1 and those who received alpelisib for ≥21 days, were observed for ≥28 days and underwent the required safety evaluations for Cycle 1). Patients were eligible for the dose-determining set if, in Cycle 1, they met the minimum treatment and safety evaluation requirements: (1) were treated with the planned dose of alpelisib for ≥21 days (i.e. received 21 of 28 doses); (2) received 75% of the planned dose of fulvestrant (i.e. received 500 mg on Day 1 and at least 250 mg on Day 15); (3) were observed for ≥28 days following the Cycle 1 Day 1 dose; and (4) completed all required safety evaluations.

Cohorts of at least one to three patients evaluable for MTD determination per dose level were enrolled in the dose-escalation arm, including at least six patients at the MTD. Before the MTD could be declared, at least 12 patients had to be treated with the combination.

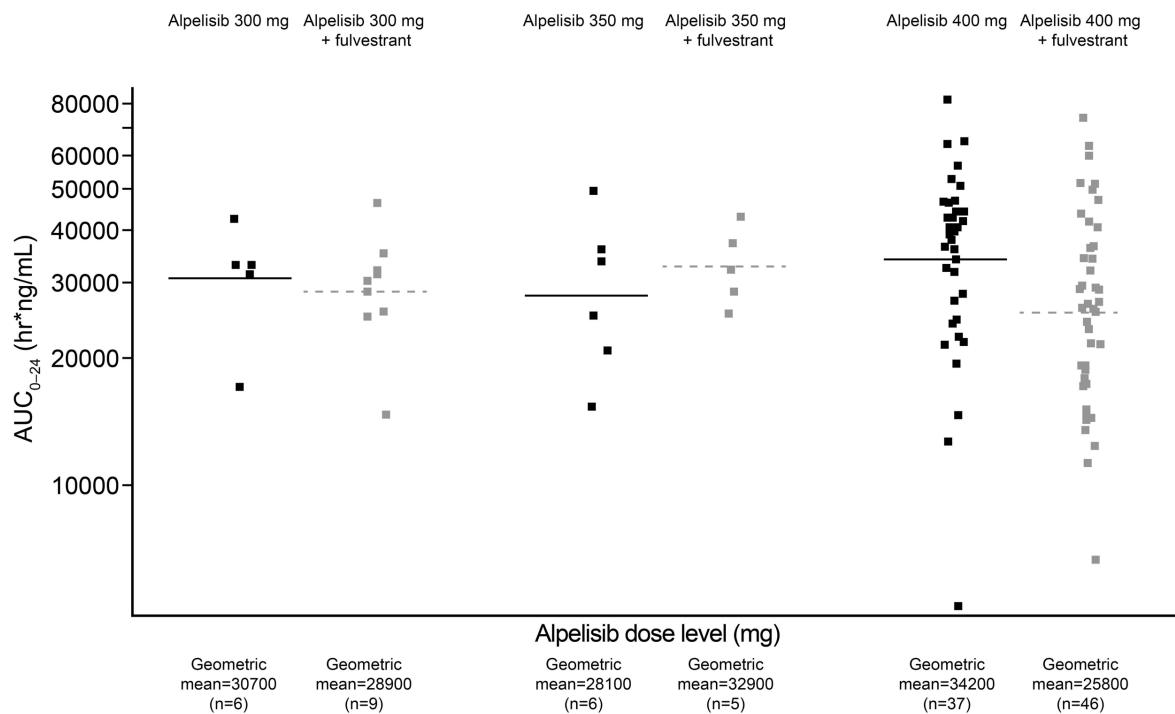

Pharmacokinetic parameters ( $AUC_{0-24}$ ,  $C_{max}$ ,  $t_{max}$  and  $t_{1/2}$ ) for each dose cohort, and at each scheduled timepoint, were analyzed by descriptive statistics, including the median (range). Strip plots of the  $AUC_{0-24}$  and  $C_{max}$  at C1D8 by treatment group were represented to compare the distribution of single agent vs combination administration data.
