

Supplementary Figure 2.

Ovarian cells infected with HSV1 expressing luciferase (HSV-luc). Normal human hTERT cells and human ovarian cancer cell lines were infected with HSV-luc (not deficient for γ 34.5 protein) at the M.O.I. 1 (**A**) or M.O.I. 10 (**B**) for 24 h and then cell lysates were analyzed by luciferase assay. RLU, relative light units. Data are representative of at least two independent experiments.
