

Fig. S10. Enoxacin enhances the antiviral effects of exogenous vsiRNA mimics in 293T cells.

293T cells were treated with synthetic ZIKV-specific siRNA mimic (10 μ M, Supplementary Table 4) or siRNA plus enoxacin (100 μ M) for 24 hrs, and then infected with ZIKV at an MOI of 2. ZIKV genome RNA were determined by RT-qPCR at 48 h.p.i, and the level of ZIKV RNA in N.C. siRNA treated cells (Mock) was defined as 1. All data are shown as means \pm SD of two independent experiments, one-way ANOVA, ** $p < 0.01$, **** $p < 0.0001$.
