

Supplementary Figure S3. Combination of Cho ABC with hyaluronidase (Hylenex) does not lead to further enhancement of pDNA-encoded protein expression in NZW rabbits. Rabbits were treated with PBS + pDNA, Cho ABC + pDNA, or Cho ABC + Hylenex + pDNA. Formulations were injected into the left rabbit quad muscle, and EP was initiated 1 min after injection. The graph represents the levels of serum hIgG (ng/mL) measured by ELISA 5 days after pDNA delivery. Animals per group=4-5. Statistics were acquired using Mann-Whitney tests.
